#### BEFORE THE STATE OF NEW JERSEY BOARD OF PUBLIC UTILITIES

### IN THE MATTER OF THE PETITION OF NEW JERSEY-AMERICAN WATER COMPANY, INC. FOR APPROVAL OF INCREASED TARIFF RATES AND CHARGES FOR WATER AND WASTEWATER SERVICE, CHANGE IN DEPRECIATION RATES, AND OTHER TARIFF MODIFICATIONS

BPU Docket No. WR2401\_\_\_\_

**Direct Testimony of** 

**Donald C. Shields** 

January 19, 2024

Exhibit P-5

## SHIELDS DIRECT Exhibit P-5

## NEW JERSEY-AMERICAN WATER COMPANY, INC.

## **TABLE OF CONTENTS**

## Page

I.	INTR	ODUCTION	1
II.		Jersey-American Water's Capital Investment Program	
III.	Desci	ription Of Plant Additions	13
IV.	Wate	r Storage Tank Reinvestment Program	32
V.	The F	Risks of Furnishing Water and Wastewater Services	35
	А.	Public Water Service	35
	B.	Public Wastewater Service	45
	C.	Climate Variability	47

#### 1 I. INTRODUCTION

#### 2 **1. Q.** Please state your name and business address.

A. My name is Donald C. Shields, and my current business address is 1 Water Street,
Camden, New Jersey 08102.

#### 5 2. Q. By whom are you employed and in what capacity?

A. I am employed by American Water Works Service Company, Inc. ("Service
Company") as Vice President of Engineering supporting New Jersey-American Water
Company, Inc. ("New Jersey-American Water," "NJAWC" or the "Company"),
Virginia-American Water Company ("VAWC") and Maryland-American Water
Company ("MAWC").

#### 11 **3. Q.** What are your responsibilities in this position?

- A. My present responsibilities include providing oversight, expertise and consultation for
   comprehensive system planning for use in developing system priorities and projecting
   capital spending, as well as the planning, design and construction of capital
   improvement projects for NJAWC, VAWC and MAWC.
- 16 4. Q. Please describe your educational background and business experience.
- A. Please refer to Appendix A for a summary of my educational background and business
  experience.

#### 19 5. Q. Have you previously testified in regulatory proceedings?

A. Yes. I have previously testified on behalf of NJAWC in the Company's base rate case
applications in BPU Docket Nos. WR15010035, WR17090985, WR19121516 and

1	WR22010019, in the Company's various DSIC and WSIC filings and in the Company's
2	joint petition for approval of the acquisition of Shorelands Water Company, BPU
3	Docket No. WM16101036. In addition, I have previously testified on behalf of Applied
4	Wastewater Management, Inc. in its base rate case applications in BPU Docket Nos.
5	WR08080550 and WR03030222.

6

#### 6. Q. What is the purpose of your testimony in this proceeding?

7 A. I will explain NJAWC's capital investment planning process and describe and support 8 the Company's investments in water and wastewater utility plant and equipment since 9 the last base rate case through the end of the test year in this case, 12 months ending 10 June 30, 2024 ("Test Year") and the six months post-test year ending December 31, 11 2024 ("Post-Test Year" or "PTY"), totaling approximately \$1.0 billion. Although my 12 testimony will highlight certain capital projects placed in service during the Test Year 13 or planned to be in service by the end of the PTY period, all capital investments, 14 including recurring projects, are reasonable and necessary to continue to provide safe 15 and reliable water and wastewater service for the benefit of our customers. I will also 16 describe the Company's plan for the engineered coating of steel structures. Finally, I 17 describe some of the risks associated with the provision of water service, the provision 18 of wastewater service and the challenges increased climate variability creates for water 19 and wastewater utilities.

20

#### 7. Q. Do you sponsor any schedules as part of your Direct Testimony?

A. Yes. I am sponsoring Schedule DCS-1 Test Year plant additions and Post-Test Year
 plant additions supporting the Company's capital expenditures utilized in rate base.

1		The Schedule was prepared by me and under my supervision and direction and will be
2		updated over the course of the proceeding to include actual data for both the full twelve-
3		months of the Test Year as well as the 6-month Post-Test Year period.
4	II.	NEW JERSEY-AMERICAN WATER'S CAPITAL INVESTMENT PROGRAM
5	8. Q.	Please explain the Company's capital investment planning and governance
6		process.
7	A.	The Company uses a standardized Capital Program Management ("CPM") process to
8		manage all its capital investments. NJAWC conducts comprehensive planning studies
9		("CPS") to assess and make project recommendations for its capital assets and
10		evaluates capital needs on an ongoing basis to assess any changed circumstances and
11		ensure that appropriate projects are being prioritized. Capital investment programs and
12		projects are prioritized within an overall strategic planning process, utilizing drivers
13		associated with various asset investment strategies (such as safety, regulatory
14		compliance, capacity, customer satisfaction, etc.) to formulate a five-year strategic
15		capital investment plan (hereafter, referred to as "capital investment plan"), which
16		largely supports the Company's capital construction plan. For investment projects
17		contained within the capital investment plan, detailed design engineering is conducted,
18		and implementation plans are developed. Main replacement projects are examined
19		annually and assigned priorities on a state-wide basis.

20 Numerous factors are considered when determining funding allocations for 21 infrastructure investment, such as current and future service needs, assessments of the 22 physical condition of existing plant, economic and risk factors, performance

1	characteristics, regulatory compliance, financial impacts to customers (rate impact) and
2	the potential to coordinate with municipalities and other utilities in joint improvement
3	projects. The CPM governance process provides for formal approvals and consistent
4	controls that optimize the effectiveness of asset investment. Strategic project planning,
5	budgeting and ongoing reviews ensure that NJAWC can manage a wide variety of
6	projects within the overall cost of its plant construction budget.

## 9. Q. Please describe the CPS process and project prioritization activities in more detail.

9 A. The CPS process includes a thorough evaluation of demand projections, regulatory 10 requirements, asset service reliability and quality, infrastructure condition, asset 11 impacts on safety and efficiency, customer rates, public fire protection, and 12 environmental sustainability. The CPS identifies, assesses, and provides project 13 recommendations for the Company's capital assets on a multi-year planning horizon 14 and includes a thorough planning level evaluation of each component of utility 15 infrastructure. The Company also undertakes separate studies or evaluations for 16 specific capital projects that emerge between each CPS. Capital investment projects are 17 identified and are prioritized using asset investment strategy considerations of safety, 18 regulatory compliance, capacity and growth, infrastructure renewal, efficiency, 19 resiliency, reliability, and quality of service. Each CPS and any additional 20 prioritization of identified capital investment projects are key inputs to the Company's 21 capital investment plan. Because of the specific nature of the large asset class of 22 distribution system mains, the Company completes a separate distinct evaluation for

1	identifying capital investment priorities in the distribution system. This evaluation is a
2	detailed prioritization modeling of the distribution system piping that, as further
3	described below, assesses service risks associated with pipeline failure risks for all the
4	Company's approximately 9,970 miles of mains.

#### 5 10. Q. Please describe the distribution system prioritization modeling in more detail.

A. As discussed in the Company's Distribution System Improvement Charge ("DSIC") 6 7 Foundational Filings, most recently NJBPU Docket No. WR22030230 Appendix B (of 8 the filing), the Company maintains a Geographic Information System ("GIS") - based 9 prioritization model using GIS software and prioritization modeling software for 10 identifying and prioritizing pipeline replacement investments across its systems. The 11 model prioritizes pipe replacements through identification of service risks associated 12 with pipe failure. Pipe failure risks are identified through pipe failure history, pipe 13 material type, the decade pipe was installed, and pipe diameter. Pipe failure history is 14 a significant input into the main replacement prioritization model. These pipe failures 15 are identified not only during the Company's unscheduled main replacement projects 16 but also during pipeline repair work. Pipe failure data is collected and tracked in the 17 Company's GIS system. Consequences of pipe failures, which include customer 18 impacts, are also an input to the prioritization model. Pipe failures not only impact 19 individual customers but can also cause consequences that are major in nature to 20 businesses, hospitals, governmental buildings, and the ability to provide fire service.

#### 1 **11. Q.** How does the Company develop and update its capital investment plan?

2 A. Investment projects are profiled in the capital investment plan to address priorities in 3 each CPS in an appropriate time frame. For example, infrastructure capacity expansion 4 investment projects are scheduled based on demand projections. Capital investment 5 projects required to meet both environmental and water quality regulations are 6 scheduled for completion before compliance deadlines to allow adequate time for 7 testing and operational performance monitoring of the new facility/assets to ensure 8 compliance. This process ensures the facility operates successfully through varying 9 operating conditions. Rehabilitation projects for service reliability are scheduled with 10 consideration of existing asset characteristics, and risks and impacts of failure on 11 service reliability and quality. Main replacement projects are identified and prioritized 12 using the prioritization model discussed earlier in my testimony.

## 13 12. Q. Please describe the general project categories in the Company's capital investment plan.

15 A. The Company's capital investment plan can be divided into two distinct areas: 16 recurring projects ("RPs" or "RP") and investment projects ("IPs" or "IP"). RPs are 17 designated as such because they are the type of capital projects that the Company 18 undertakes on a frequent and regular basis, require less long-term financial and capital 19 planning than an IP, and can be performed with either the Company's current 20 workforce or existing contractors. IPs on the other hand, are typically projects that 21 require more planning and design detail as well as a lengthier procurement lead time and actual construction time.. Whether RPs or IPs, all aspects of the Company's capital 22

1		program are essential to continuing to provide safe and adequate service to NJAWC's
2		customers and support the long-term viability, reliability and resiliency of the
3		Company's water and wastewater systems.
4	13. Q.	Please describe the RPs that are included within the Company's capital
5		investment plan.
6	A.	NJAWC's RPs include main replacement projects that are generally 12 inches in
7		diameter and smaller, reinforcement and replacement of service line and meter setting
8		installations, meter purchases, projects to replace and maintain treatment equipment,
9		vehicle replacements and to a lesser extent the purchase of tools, furniture, and
10		equipment. The Company's RP investments during the Test Year and PTY total
11		approximately \$453.2 million (see Schedule DCS-1).
12	14. Q.	Are RP projects a critical component of the Company's capital investment plan?
13	A.	Yes, RPs are critical investments for both the Company and customers as these
14		investments support the backbone of NJAWC's water systems by increasing both
15		system resiliency and reliability.
16	15. Q.	Please describe how RPs are included within the Company's capital investment
17		plan.
18	A.	The various line-item costs for recurring projects are trended from historical and
19		forecasted data, with specific project details accounted for where available. Main
20		replacements are planned in accordance with the Company's project prioritization plan
21		as described herein. Cost estimates for main replacement projects are prepared for the

1	installation of new mains and service lines, meter settings, and the purchase of new
2	meters based on preliminary plats from the appropriate governmental planning
3	agencies and consultations with developers, homebuilders, and engineering firms. The
4	criteria for evaluating the priority of the recurring projects are engineering
5	requirements, consideration of national, state, and local trends, environmental impact
6	evaluations, and water resource management. NJAWC engineering criteria are based
7	on accepted engineering standards and are developed from regulations, professional
8	standards and NJAWC engineering policies and procedures. The engineering criteria
9	support NJAWC's ability to have a water system that will continue to provide adequate
10	capacity and appropriate levels of reliability to satisfy residential, commercial,
11	industrial, and public authority needs, and provide flows for fire protection.

## 12 16. Q. Please describe how IPs are included within the Company's capital investment 13 plan.

A. IPs represent investments made to meet environmental or water quality regulations,
 enhance system resiliency and reliability, expand infrastructure capacity, and either
 rehabilitate or replace aging facilities. These projects allow the Company to meet the
 service demands of the community, maintain regulatory compliance, and reduce asset
 failure.

19 The determination to include an IP within the capital investment plan begins with the 20 development of the anticipated demand projections of the system, the identification of 21 improvements needed to meet those demands, and the adoption of strategies designed 22 to bring about the correct prioritization and distribution of capital spending for the

1	various requirements of the business. Specific capital planning requirements are
2	addressed in both the short term (one year) and the longer term (five years). Projects
3	are prioritized using objective criteria that validate the need for a project and assess the
4	risk of not doing the project. A key aspect of this planning technique is that it is flexible
5	and can be adjusted as needed to address new priorities, such as unplanned equipment
6	failures, large or sudden growth of a service area, and new regulatory requirements.

## 7 17. Q. Please describe the Company's recent performance with respect to its capital 8 investment plan.

9 A. NJAWC has successfully delivered its capital investment plan over the past five years.
10 Capital investment plans, actual capital investment deliveries, and variances to the plan
11 by year are shown in the table below:

	NJAWC Ca	apital Investment Pla	an vs. Actual	
Year	Plan	Actual	Variance	%
2016	310,129,159	312,717,235	2,588,076	0.83%
2017	395,807,573	396,832,035	1,024,462	0.26%
2018	343,331,837	347,782,915	4,451,078	1.30%
2019	344,838,815	362,158,711	17,319,896	5.02%
2020	438,245,187	430,413,130	(7,832,057)	-1.79%
2021	406,456,859	422,127,704	15,670,845	3.86%
2022	523,659,537	556,096,133	32,436,596	6.19%
Cumulative	2,762,468,967	2,828,127,863	65,658,896	2.38%

## 18. Q. Does NJAWC focus on control of capital expenditure costs in its normal day-to day activities?

3 A. Yes. All significant construction work is performed by independent contractors and 4 some significant purchases are completed pursuant to a bid solicitation process. 5 NJAWC maintains a list of qualified bidders, and Service Company annually receives competitive bids for materials and supplies, such as pipe, valves, fittings, meters, 6 7 chemicals, and other commodity items that are either manufactured or distributed both 8 regionally and nationally through its centralized procurement group. Through the size 9 and breadth of American Water, NJAWC has the advantage of being able to purchase 10 these materials and supplies on an as-needed basis at favorable prices. In recent years, 11 Service Company also has undertaken procurement initiatives for services and 12 materials to reduce costs or mitigate price increases through either streamlined 13 selection or utilization of large volume purchasing power. Among the initiatives that 14 have directly impacted capital expenditures are the use of master services agreements 15 with pre-qualified engineering consultants, national vehicle fleet procurement, and 16 national preferred vendor identification. Mr. Shroba describes how NJAWC utilizes 17 the Supply Chain team within Service Company to take advantage of the purchasing 18 power of the entire American Water enterprise and control costs.

# 19 19. Q. Please describe some key achievements realized by the capital investment 20 program at the Company.

A. There are several key areas that NJAWC has addressed with its capital investment
 program. First, we've made significant improvement in replacing aging infrastructure,

- largely attributable to the main replacement program. As stated in the Company's latest
   DSIC Foundational filing (WR22030230):
- 3 Prior to 2012, approximately forty-five percent (45%) of NJAWC's mains were cast 4 iron ("CI") (unlined & lined), indicating that almost half of NJAWC's water mains 5 were more than fifty years old, and in many cases, significantly older. Through the 6 main replacement program, measurable progress is being made. NJAWC's cast iron 7 inventory as of December 2021 is approximately 38% of the total inventory, and 8 approximately 49% of the CI inventory is lined, which includes rehabilitation through 9 the cleaning and lining method. There remains a total of approximately 1,778 miles 10 (19%) of unlined cast iron mains within NJAWC's distribution system. Since 2012, 11 there has been a net reduction of the cast iron pipe inventory of 7%.
- 12 Since 2012, the Company has:
- replaced over 950 miles of main, 120,200 service lines, 15,500 hydrants and
  30,700 valves.
- lowered its water main replacement rate from over 500 years to below 120 years,
  which is within the New Jersey Water Quality Accountability Act requirement of
  150 years.
- invested a total of \$1.553 billion in DSIC-eligible system improvement projects to
   replace or rehabilitate aging infrastructure.

SHIELDS DIRECT Exhibit P-5

Second, the Company has made significant enhancements for asset renewals which also
include system reliability and resiliency. Some key projects completed within the last
five years include:
Mill Road Iron and Manganese Removal
Route 9 Water Main Replacement
• Linden NJ 42" PCCP main replacement
Oxford Station Treatment System Upgrades
Vincentown Supply Reliability
Lastly, the Company has invested significantly in facilities for regulatory compliance.
Of note, the Company now operates many systems to treat for regulated perfluorinated
compounds (PFOA, PFOS and PFNA) throughout the State. Additional facilities under
construction currently include the following:
• Oak Street PFAS (Lakewood)
• Cooper Ivy Station Upgrades (PFAS, Radium and 1-4 Dioxane)
As further discussed below in my Direct Testimony, the Company continues to prepare
for new and more stringent regulations on emerging compounds and intends to take
early action on planned upgrades and operational mitigation strategies to address these
regulatory challenges.

#### 1 III. <u>DESCRIPTION OF PLANT ADDITIONS</u>

#### 2 **20.** Q. How much capital investment is the Company seeking to recover in this case?

3 A. Since the effective date of rates in the Company's last rate case, the Company has 4 invested, or plans to invest, approximately \$1.3 billion in capital expenditures through 5 the end of 2024. For total plant in service please see Ms. Hawn's Direct Testimony, 6 Exhibit P-6. As shown on Schedule DCS-1, beginning July 1, 2023, and through the 7 end of the post-test year, the Company has invested or plans to invest over \$860 million 8 in its water and wastewater facilities. Of that amount, \$561.4 million will be invested 9 during the Test Year and an additional \$300 million will be invested during the Post-10 Test Year.

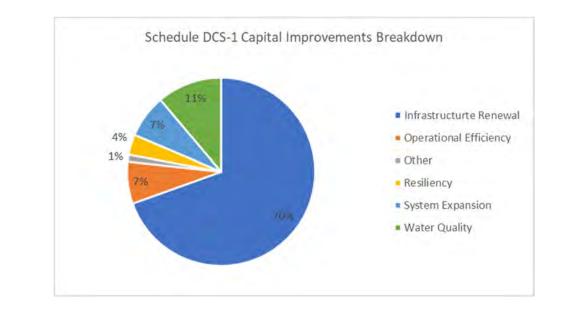

## 21. Q. Please describe some of the key objectives related to the Company's investments and how they benefit customers.

13 A. The Company's investments since the last rate case address key issues for our 14 customers, including improving asset resiliency, managing source of supply and system 15 demands, renewing aging assets, increasing operational efficiency, and maintaining 16 regulatory compliance. The projects the Company undertakes are designed to achieve 17 multiple goals and are essential for the Company to continue to provide safe, adequate, 18 and reliable service in a manner that is in the long-term interest of our customers. For 19 example, many of these projects in Schedule DCS-1 are described below and include 20 improved resiliency and reliability at treatment plants, as well as in the distribution 21 system, managing source of supply both from a treatment and capacity perspective, 22 improved pump efficiency, treatment changes to maintain regulatory compliance, and

1		so on. Additional examples include investments that further enhance the Company's
2		hardware, software, and related technology appurtenances and systems. In each
3		instance, these projects support the Company's continued provision of safe, adequate,
4		and reliable service to customers.
5	22. Q.	Please describe generally the capital expenditures through the Test Year as
6		detailed further in Schedule DCS-1.
7	A.	Schedule DCS-1 provides a summary of capital expenditures for the Test Year and
8		Post-Test Year periods. The Test Year investment of approximately \$358 million
9		shown in Schedule DCS-1 includes five months of actual capital expenditure data for
10		the period July 1, 2023, through November 30, 2023 and seven months of projected
11		capital expenditure data for the period December 1, 2023, through June 30, 2024. As
12		the Test Year is fully realized, NJAWC will supplement the projected data with actual
13		data through June 30, 2024, in the Company's 9&3 and 12&0 updates to be submitted
14		in this case.
15	23. Q.	Please summarize the Post-Test Year capital expenditures for which NJAWC is
16		seeking rate relief in this proceeding as shown on Schedule DCS-1.
17	A.	The Company's Post-Test Year investment of approximately \$312 million is based on
18		projected capital expenditures NJAWC plans to make during the six-month period July
19		1, 2024, through December 31, 2024. NJAWC's Post-Test Year capital expenditures
20		are known and measurable consistent with Board precedent, including In Re
21		Elizabethtown Water Company, BPU Docket No. WR8504330 (May 23, 1985).
22		Moreover, NJAWC's Post-Test Year capital expenditures are "prudent and major in

1	nature and consequence" and, therefore, have been included in rate base for cost
2	recovery.
3	24. Q. Please provide an overview of the investments included in Schedule DCS-1.
4	A. As described in my Direct Testimony above, the capital program is driven by
5	investments in plant to address the following issues:
6	• Infrastructure Renewal
7	Operational efficiency
8	• Water Quality
9	• System Expansion
10	• Resiliency/Reliability
11	• Other – administrative and facilities
12	Projects can fall into several categories that meet various identified needs. For example,
13	a filter upgrade project at a remote groundwater station can be identified as an asset
14	renewal project if it is needed to replace outdated technology, which would also qualify
15	it for operational efficiency. In addition, the project could also be categorized as a
16	water quality enhancement should the filtration technology be upgraded to also remove
17	new emerging compounds.
18	As can be seen in the chart below, the vast majority of NJAWC's projects fall into the
19	Infrastructure Renewal category.

SHIELDS DIRECT Exhibit P-5

#### NEW JERSEY-AMERICAN WATER COMPANY, INC.

A further explanation and description of these categories is included herein, along with additional details regarding certain projects in each category. Additional information regarding all the projects or line items in Schedule DCS-1 can be provided upon request.

1

## 6 25. Q. Please describe the Company's infrastructure and asset renewal investments in 7 more detail.

8 A. Asset management is recognized as an industry best practice, and the United States 9 Environmental Protection Agency ("USEPA") has been directed under America's 10 Water Infrastructure Act of 2018 ("AWIA") to require states to incorporate asset 11 management into their capacity plans, with several states having adopted requirements 12 for water utilities to complete asset management plans ("AMPs"). Additionally, under 13 the New Jersey Water Quality Accountability Act ("WQAA"), water utilities are 14 required to maintain an AMP similar to the AWIA requirements. NJAWC follows the key steps set forth by both USEPA and the WQAA for sound asset management, 15

1	including maintaining an accurate inventory of assets, providing an assessment of the
2	condition and performance of these assets, with particular emphasis on high-criticality
3	assets, performing risk assessment of assets in terms of their criticality and potential
4	for failure and service disruption, and providing a recommended renewal program that
5	includes operations and maintenance ("O&M") and inspection.
6	It is well documented that the water and wastewater utility industry is faced with
7	significant capital investment needs to renew aging infrastructure. <sup>1</sup> Nationwide, water
8	system pipeline replacement rates are in the range of 0.45% per year, which translates
9	to a replacement cycle of approximately 200 years. Through heightened focus on this
10	issue, and as described herein, NJAWC has significantly improved its pipeline
11	replacement rate over the last few years, from near industry average levels in 2011 to
12	a five-year average rate of 0.85% from 2018-2022 (latest full year available).
13	NJAWC regularly assesses whether the current asset renewal investment levels, for
14	both above ground and buried assets, are sufficient to maintain appropriate levels of
15	service. NJAWC employs a multi-faceted approach to managing assets, including the
16	use of innovative technologies to detect, mitigate, or repair asset failures; condition-
17	based and/or reliability-centered maintenance; and a risk-based strategic plan and
18	framework for prioritizing and implementing asset renewal while considering the
19	impact on customer rates. Alternative asset renewal technologies, including pipeline
20	rehabilitation, are considered wherever cost-effective.

<sup>&</sup>lt;sup>1</sup> See, e.g., American Water Works Association, *Buried No Longer: Confronting America's Water Infrastructure Challenge* (2012), <u>https://www.awwa.org/Portals/0/AWWA/Communications/BNLReport.pdf</u>.

- Some examples of infrastructure and asset renewal projects included on Schedule
   DCS-1 follow:
- 3 Central Lead Service Line Replacements – This project includes the investigation of all unknown Company and customer side service lines as well as the 4 5 investigation and replacement of known lead service lines in Central Raritan East 6 operating region. The replacement of known lead service lines in the Central 7 Raritan East operating region will occur within eight towns and will be addressed 8 in order of the prioritization model produced by CDM Smith as part of the statewide 9 program. The bulk of the replacements that have already occurred under this project 10 were located in Hillside. The remaining scope of the project includes an anticipated 11 4,000 services replacement goal for DEP reporting Period of July 2023 to July 2024 12 with an average estimated cost of \$6,000 each. The remaining seven towns are:
- 13 o Dunellen- 21 Suspected and 1929 Unknown -Anticipated Total of 151
  14 Replacements.
- 15 o Linden- 192 Suspected and 9,952 Unknown -Anticipated Total of 1283
   16 Replacements.
- 17 o Middlesex- 23 Suspected and 4,266 Unknown -Anticipated Total of 297
  18 Replacements.
- 19 o North Plainfield- 581 Suspected and 3,150 Unknown -Anticipated Total of
  20 1685 Replacements.
- Plainfield- 861 Suspected and 8,399 Unknown -Anticipated Total of 4,905
   Replacements.

1	c	Roselle- 212 Suspected and 4,381 Unknown -Anticipated Total of 1,121
2		Replacements.
3	c	Roselle Park- 484 Suspected and 2,016 Unknown -Anticipated Total of 1,250
4		Replacements.
5	С	The estimated project total is 11,742 Anticipated Replacements.
6	1	Note that this project will be eligible for Principal Forgiveness ("PF") under the I-
7	Η	Bank program. Estimated PF for this project is \$5M. Final PF amounts will be
8	Ċ	letermined by the I-Bank at the conclusion of the project (conversion to long term
9	14	oan).
10	• F	Raritan Millstone ("RM") Filterhouse and HVAC Improvements – This project
11	С	consists of replacing aging heating cooling and ventilating systems within the filter
12	b	buildings and "head house" building at the RM plant to improve reliability and
13	e	energy efficiency at these areas. These areas are of critical importance as they house
14	S	ensitive instrumentation and control systems for measuring flows, turbidity and
15	С	hlorine levels and any temperature and humidity variations can cause
16	С	condensation and subsequent corrosion of these systems. The older steam-based
17	h	eating system had reached the end of useful life and was inefficient and incapable
18	C	of adequate heating. Ventilation units were likewise older, and inefficient as well
19	a	is incapable of providing adequate air changes. Also, doors, windows and roof
20	p	penetrations (skylights, etc.) are aged and do not provide adequate insulation and
21	а	re prone to significant air leakage.

1 The project includes removal and replacement of the old inefficient compone	
2 with new high efficiency heating systems, air handling units, ventilation syst	em
3 components as well as replacement of doors windows and roofing component	ıts.
4 Elements of heat recovery from the engine driven pumps will be incorporated	to
5 enhance efficiency.	
• Long Hill Twp. ("LHT") WWTP Filter and Pump Improvements – the exist	ng
7 LHT WWTP is currently unable to pump and treat peak daily and hourly flow. 7	'he

8 system has historically needed to bypass the tertiary filter units once flows exceed 9 2.8MGD. Additionally, the influent pumping capacity is limited to a reliable 10 capacity of only 3.4MGD while the plant is rated for a flow (peak hour) of 5.2 11 MGD. The inability to pump the peak flows results in sewer system backup into 12 the collection system which increases the potential risk of sanitary system 13 overflows which would result in a Notice of Violation to be issued by the New 14 Jersey Department of Environmental Protection ("NJDEP"). Additionally, the 15 building is also located in a flood plain area and is in need of flood protection 16 measures to enhance the plant's resiliency. The buildings also require various 17 repairs to the roof, walls, windows and doors. The improvements included in this 18 project include the following:

- 19 Replace the existing influent pumps No. 3 and No. 4
- 20 o Replace the four (4) Return Activated Sludge (RAS) pumps
- 21 Replace the existing sand filters with new disc filters
- 22 o Perform UV Building Improvements
- 23 o Perform Digester Building Improvements

- 1
- Perform miscellaneous site repairs/replacement

2 Glen Meadows WWTP Upgrades - The Glen Meadows WWTP is a small extended • 3 aeration wastewater treatment facility located in Clinton Township, Hunterdon 4 County, NJ. The plant serves both the Glen Meadows and Twin Oaks residential 5 developments, having a combined total of 58 single family homes. The plant 6 receives only gravity flow from the customers. Its rated capacity is 25,000 gallons 7 per day and operates under NJPDES Permit NJ0100528. The existing extended 8 aeration treatment equipment is nearing the end of its useful life. There is a 9 structural deficiency with the base slab for the aeration tanks and the steel walls of 10 the aeration tanks have become structurally unstable. There is significant corrosion 11 of the walls with holes in certain areas requiring frequent patching. The existing 12 sand filters have corroded and are leaking. The project includes removal and 13 replacement of all treatment tanks and equipment and replacing same with new 14 tanks and equipment to handle existing flows.

#### 15 **26. Q.** Please describe the Company's operational efficiency investments in more detail.

A. Targeted capital investment can improve operational efficiency which can decrease, or mitigate increases to, O&M expenses. For example, NJAWC routinely seeks opportunities for energy use reduction when evaluating equipment rehabilitation and replacement needs to continue to support the provision of reliable service. While the primary focus is on pumps and motors, alternative energy production is also considered, as these technologies are becoming more cost-effective, especially where incentives are available. NJAWC also has identified advanced leak detection methods

1	that can more efficiently identify and address leakage. Reducing water loss has the
2	attendant benefit of reducing the costs associated with producing and pumping the non-
3	revenue water ("NRW") over time. These types of projects, along with technology
4	solutions that improve worker productivity, streamline the customer experience, or
5	improve overall system efficiency to help keep our costs down. One key example of
6	the Company's efforts for improving water efficiency includes the NRW Management
7	- Central Project. This project entails replacement of 1735 hydrant mounted nodes that
8	have reached the end of their useful life (battery depletion and discontinuance of 3G
9	cellular communication). The units to be replaced are located in Piscataway, Roselle,
10	Somerville, Jamesburg, Manville, and Kenilworth. The updated units are expected to
11	have an increased useful life of 10 years and will allow the Company to continue its
12	efforts to reduce leakage in its Central Operating Region.
12 13	efforts to reduce leakage in its Central Operating Region. 27. Q. Please describe the Company's water quality investments in more detail.

1	substances ("PFAS") and 1,4-dioxane in drinking water supplies. Recent advances in
2	analytical methods have revealed the presence of CECs in some drinking water supplies
3	at previously undetectable parts-per-trillion ("ppt") levels. Research is ongoing, but
4	some scientific studies have identified potential health concerns for a number of these
5	compounds even at the low ppt levels. As a result, USEPA had established health
6	advisory levels ("HALs") for some PFAS and other CECs and has begun the process
7	to establish MCLs for PFOA and PFOS.
0	
8	The State of New Jersey has established MCLs for some CECs, including PFNA, PFOS
9	and PFOA, <sup>2</sup> in advance of USEPA establishing federal limits; limits for PFNA were
10	adopted by NJDEP in 2018 while limits for PFOS and PFOA were adopted by NJDEP
11	in 2020. The Company has completed or is in the process of completing several projects
12	to meet state MCLs.
13	In March of 2023, USEPA issued proposed national primary drinking water regulation
14	for certain PFAS as described in the March 29, 2023, Federal Register (88 FR 18638).
15	In summary, the USEPA has proposed MCLs of 4.0 parts per trillion (ppt) for PFOA
16	and PFOS while introducing regulation of PFHxS, HFPO-DA, PFNA, and PFBS
17	coupled with the use of a Hazard Index Approach to Regulate PFHxS, HFPO-DA,
18	PFNA, and PFBS <sup>3</sup> .

 <sup>&</sup>lt;sup>2</sup> See <u>https://dep.nj.gov/pfas/standards/</u> for details.
 <sup>3</sup> See <u>https://www.epa.gov/sdwa/and-polyfluoroalkyl-substances-pfas</u>.

1 Some examples of water quality projects included on Schedule DCS-1 follow: 2 • Mill Road - North Linwood Iron Removal - In recent years the area around the 3 Mill Road Station has experienced high levels of discolored water resulting from 4 excess Manganese levels. The station had historically sequestered both iron and 5 manganese with a sequestering chemical (Klephos 100) but increasing levels of 6 manganese as well as oxidation issues (from required chlorination) caused the 7 release of the manganese (as well as lesser levels of iron). The levels have exceeded 8 the secondary drinking water quality standards and cause the Company to expend 9 significant resources to resolve the issues for customers; operational mitigation 10 includes increased flushing frequency, changes to chemical levels flows and 11 pressures as well as individual customer outreach. While these efforts are somewhat 12 effective in the short term, they are not long-term solutions to the problem. The 13 project includes construction of a new building at the MRS site to house manganese 14 dioxide media filters for the removal of particulate iron and manganese. The plant 15 is designed to treat the current well capacity of 1,390 gpm. The design also allows 16 for the expansion of the facility to treat as much as 2,140 gpm (3.08 mgd) in the 17 future, with future provisions for the construction of a new well will be brought 18 online for treatment at the facility. This includes, but is not limited to, additional 19 filtration, packed tower air stripping, chemical storage and feed, and hydraulic 20 capacity.

Oak Street PFAS – Due to elevated levels of PFOA/OS at the Oak Street Well
 Station, located in Lakewood, NJ, installation of new treatment equipment is

1	required. The new equipment will consist of either granular activated carbon or
2	anionic exchange media and associated vessels, chemical feed equipment as well
3	as upgrades to instrumentation and control systems. The equipment will be housed
4	in a new structure and will be sized for full system flow.
5	• Oxford Well Station ("OWS") Treatment Upgrades – The OWS treats water from
6	two wells for Volatile Organic Compounds ("VOC's") removal with GAC
7	adsorption and sodium hypochlorite is added for disinfection. Low levels of
8	trichloroethene ("TCE") are treated with a temporary treatment system consisting
9	of seven (7) GAC contactors. As part of its permit renewal process, NJDEP required
10	that the temporary GAC units be replaced with a permanent treatment solution. In
11	addition to the VOC removal, 1,4-dioxane has also been detected at the wells.
12	Because these wells are the primary source of water for Oxford customers, the
13	Company plans to install a new treatment system designed to address VOCs and
14	1,4-dioxane in addition to TCEs. The system includes AIX and peroxide for
15	advanced oxidation for 1,4-dioxane removal while also removing the VOC's in the
16	raw water.
17	28. Q. Please describe the Company's resiliency and reliability investments in more
18	detail.
19	A. The increasing frequency of extreme weather events and other natural disasters as
20	magnified by climate variability has significantly challenged NJAWC's infrastructure.
21	Water and wastewater systems have been traditionally designed and maintained to
22	provide reliable service under standard design conditions ( <i>e.g.</i> , 1-in-50 year drought,

1 1-in-100 year flood, etc.). Such standards, however, are based on historic climate 2 patterns that may no longer be typical. Systems may be expected to cope with more 3 extreme and frequent droughts, floods, power outages, and storms that may impact 4 service. In addition, other man-made events such as source water contamination, and 5 accidental or purposeful damage to facilities may result in significant impacts on 6 customer service and asset integrity.

7 For NJAWC's most critical assets, defined as those with the highest consequence of 8 failure, capital investments to further "harden" systems against identified natural 9 threats are prioritized for implementation. Non-capital solutions are also part of the 10 solutions toolkit to provide more system resiliency in mitigating such risks, such as 11 more robust emergency response plans ("ERPs"), drought management plans, 12 condition-based and/or reliability-centered maintenance, and other operations plans 13 and asset management strategies that enable better preparedness and ultimately more 14 assurance that reliable service can be maintained.

In October 2018, Congress passed AWIA, which includes revisions to the Safe Drinking Water Act ("SDWA") that require all water systems serving populations greater than 3,300 people to complete Risk & Resiliency Assessments ("RRAs") and update their ERPs over a three-year period. NJAWC has completed RRA's for affected systems in accordance with compliance deadlines. Capital improvements identified through this process aimed at reducing risk and improving system resiliency are considered for incorporation into the Company's capital plan.

- Some examples of resiliency and reliability projects included on Schedule DCS-1
   follow:
- 3 Oak Tree Booster Station Upgrades – The Oak Tree Booster Station Complex is 4 located in Edison Township, New Jersey. On this property are three critical 5 NJAWC facilities: New Oak Tree Booster Station, New Oak Tree MCC/Generator 6 Building, and the Old Oak Tree SCADA/Pump Building. Also on site are storage 7 tanks #1-4 which are 10 MG, 10 MG, 5 MG, and 1 MG. This station is a critical 8 facility that supports flows that feed the eastern half of the Central 273 and 274 9 gradients and serves as an interconnect to feed the Jerusalem Road reservoir and 10 booster station as well as feed to NJAWC's North (Passaic) system Diamond Hill 11 Booster. Reliability at this station is critical to maintain service to hundreds of 12 thousands of residential customers as well as commercial and bulk customers.
- 13 The Oak Tree booster station suffers from both aging/obsolete infrastructure and 14 poor pump efficiencies. The existing pumps were installed between 1965 and 1993. 15 Pump efficiency tests indicated that the existing pumps were performing below 16 their rated efficiencies and were in the mid to low 60% range. Furthermore, the age 17 of the equipment (specifically Pumps 1-4; vintage 1960's) is a concern relative to 18 reliability, repairs and maintenance. The booster station has a number of structural 19 deficiencies, including concrete deterioration and cracking which has required 20 emergency structural stabilizing. Significant structural repairs are needed to extend 21 the useful life of the original structures.

1 The project work includes installation of new pumps and motors within pump 2 station 1&2 building as well as pumps 3-6 within pump station 3-6 building. The 3 work also includes removal and replacement of the motor control center and 4 associated electrical equipment. Electrical components for the pumps include 5 complete replacement of the panels and electrical equipment for Pumps 1-2 6 currently housed in the existing block building, and replacement electrical 7 equipment for pumps 3-4 with new equipment but to remain in the same housing. 8 Other related work includes replacement of electrical feeder cables for all upgraded 9 pumps.

Building structural improvements include rehabilitation of the existing CMU building; cleaning of the masonry building, crack repair, protective waterproofing, drain replacement and flashing, and reinforcement of the existing masonry pipe and exhaust fan openings. And lastly the work also includes installation of new 400kv back up generator.

15 Vincentown Supply Reliability – The existing Vincentown Well Station ("VWS") • 16 building (circa 1904) treats water withdrawn from two wells screened in the Mt 17 Laurel – Wenonah aquifer, Well No. 1 and Well No. 2. The well supplies are routed 18 to an old masonry building that also houses electrical switchgear, SCADA controls, 19 and chemical treatment [sodium hypochlorite and tetrapotassium pyrophosphate 20 (Klenphos-100)]. The VWS is located near the edge of a drop-off to a creek below. 21 Erosion of the embankment has gradually led to settling of the building. Additional 22 structural support was added in 2013 to reinforce the building and reduce the risk

1 of immediate failure. However, further erosion of the embankment could lead to 2 failure of the building, loss of the treatment process, and loss of the only supply 3 station for the Vincentown System. Well No. 1 is also located close to the 4 embankment and has suffered from instability as well; it, too, is at risk of failure 5 and cannot be either redeveloped or otherwise serviced due to the embankment 6 stability concerns.

7 Due to significant site constraints at the existing well station, a new site was 8 investigated and procured. The project work includes installation of new production 9 wells and a well station (treatment) on an easement on the Southampton Board of 10 Education property. Included in project will be two replacement wells, a new 11 treatment building for the addition of corrosion inhibitor and sodium hypochlorite 12 (on-site generation), all necessary piping and analyzers, an electrical/control room 13 as well as a permanent back-up generator. The existing Vincentown station (along 14 Retreat Road) will be removed and the existing wells on that site will be abandoned.

15 Jerusalem Rd Booster Station Improvements - This project includes design and • 16 construction work to replace the existing below grade Jerusalem Road pump 1 and 17 2 booster station with a new above grade booster station building with individual 18 mechanical and electrical rooms. The existing booster station has reached the end 19 of its useful life and is in poor condition, with the pumps and electrical equipment 20 requiring upgrades. Servicing this facility also presents a safety hazard, as pumps 21 1 and 2 are in an underground vault (confined space entry). Improvements are 22 needed for safe and continued operation of the booster station. Targeted piping

1	replacement is also needed at the station to improve hydraulic conveyance. The
2	new booster station will include two 1,500 gpm vertical turbine pumps equipped
3	with VFD's and an emergency backup generator. The new pumps will be installed
4	along with new 16-inch suction and discharge piping. Electrical upgrades to site
5	power and SCADA control functionality will also be included. In addition, a motor-
6	operated control valve MOV (altitude valve) is to be installed for the storage tank.
7	29. Q. Please describe the Company's administrative and facilities investments in more
8	detail.
9	A. While the above categories are broad and generally encompass nearly all projects
10	within the Company's capital program, there are certain projects that may fall into the
11	facilities category. This category can contain elements of each area above. For instance,
12	older facilities may lack important security features, may have inadequate ingress or
13	egress, or may have substandard fire detection and suppression systems. Mechanical
14	and electrical systems may be old and inefficient resulting in higher electric and gas
15	expense charges. And in some cases, the facilities are simply inadequate to handle the
16	materials and equipment necessary to manage the required repairs and replacements
17	for the level of service that customers expect and deserve. Lack of adequate storage
18	space for materials and equipment is often a key driver for facility improvements.
19	Projects for facility upgrades also include investments in employee offices, restrooms,
20	lockers and other support facilities. These are key investments in infrastructure
21	necessary to attract and retain an engaged workforce.

- Some examples of administrative and facilities projects included on Schedule DCS-1
   follow:
- Lawnside Operations Center Block C The Lawnside facility was originally
   designed without inside parking/storage of diesel trucks and equipment. The new
   Block C building was added in order to maximize the operating lifespan of the
   trucks, excavation equipment and related items. In addition to protection from
   inclement weather it will also prevent theft of any key parts of the equipment.
- 8 Somers Point Storage Yard – NJAWC is currently storing stone materials and other • 9 necessary items for everyday T&D work at the Somers Point Tank site. Due to the 10 location of the site and local residents' concerns about use of the site during off 11 hours operations, primarily related to emergency main repairs at night, NJAWC is 12 either faced with requesting a zoning variance or relocating the material being 13 stored. Somers Point has allowed NJAWC to continue to operate with restricted 14 hours in a temporary manner until a more permanent solution can be achieved. 15 After several rounds of investigating and evaluating several sites, the location at the 16 well station between Delilah Road and Commerce Drive has been selected as the 17 best solution. The work will involve site work and material storage equipment and 18 facilities at the well station.

#### 1 **30.** Q. Are the projects about which you are testifying in this proceeding necessary and 2 prudent in order for the Company to continue to provide safe, adequate and 3 reliable utility service? 4 A. Yes, they are. These projects are necessary to continue to provide safe, adequate and 5 reliable water service in a manner that is in the long-term best interest of our customers. 6 For example, plant improvements designed to meet water quality regulations will 7 minimize the risk of both Notices of Violation ("NOVs") and MCL violations. Projects 8 aimed at addressing health and safety risks mitigate potential accidents and improve 9 both employee and customer safety. Projects designed to improve energy efficiency 10 help to achieve the goals of improving operational efficiency and reducing energy 11 usage. Replacement of deteriorated assets can reduce the risk of system outages, which 12 helps promote high customer satisfaction. All of these examples show that prudent 13 capital investment is in the best long-term interest of our customers.

14

#### IV. WATER STORAGE TANK REINVESTMENT PROGRAM

## 31. Q. Please describe the Company's water storage tank reinvestment program ("WSTR"), also referred to as Engineered Coating of Steel Structures.

A. The Company invests millions of dollars each year in its WSTR to extend the service
life of these critical distribution system storage assets. NJAWC owns and operates 193
structures to store potable water in distribution systems for fire protection, flow
equalization and pressure management as well as management of peak demands.
Another 58 process tanks are used at treatment plants to provide potable water to
customers across the state. The integrity of these structures is crucial to helping to

1		protect public health and providing safe, adequate and reliable water service to
2		customers. Investments in these structures include the replacement of corroded steel
3		components, safety and security upgrades, and renewal or replacement of existing paint
4		(coating) systems.
5		The WSTR entails an inspection of the interior and exterior structure of the tank, a
6		prioritization program to define an annual program, bidding the work to qualified
7		licensed contractors, awarding contracts and scheduling the work, releasing the tank to
8		the contractor for the replacement of corroded steel components, the installation of new
9		safety and security upgrades, and the coating reinvestment work, followed by
10		disinfecting the tank and returning the tank to service.
	22 0	
11	32. Q.	Please describe the service life considerations for water storage tanks in
11 12	32. Q.	distribution systems.
	_	
12	_	distribution systems.
12 13	_	distribution systems. Water storage tanks are generally constructed of steel or concrete, and can be

12 13 14 15 16 17 18 19	_	distribution systems. Water storage tanks are generally constructed of steel or concrete, and can be configured as ground level storage tanks, elevated tanks or standpipes. Material of construction and type of tank are dictated by service requirements and cost. Of NJAWC's tank inventory of 251 tanks, 210 are steel and 41 are concrete. If properly designed, constructed and maintained, these tanks can be expected to have service lives of numerous decades despite exposure to harsh environmental conditions. A majority of these tanks are located outside and are exposed to a wide range of air temperature,

1 This is especially true for coastal areas where salt air is highly corrosive to steel 2 surfaces. In general, minor corrosion spots can be repaired; however, significant 3 corrosion, if left unattended, can lead to structural damage and poor aesthetic 4 conditions. In addition, this corrosion could potentially result in a breach of the tank, 5 which could lead to contamination of the tank contents from infiltration or worse, tank 6 structural failure. Proper inspection, ongoing routine care to address spot corrosion, 7 and major recoating projects can therefore extend the service life of steel tanks. 8 Concrete tanks are generally more costly to construct than steel but do not require the 9 same level of exterior reconditioning.

#### 10 **33. Q. Please describe the importance of the WSTR.**

11 A. Steel tanks require occasional, but significant investment in the coating system. 12 NJAWC utilizes a high-performance engineered coating system on both interior and 13 exterior surfaces of tanks. The service life of the interior and exterior coatings varies 14 depending upon several conditions, but typical high-performance coatings can last up 15 to about 20 years. Installation of new coating systems on existing tanks typically 16 requires removal of existing coatings to bare metal through abrasive blasting and then 17 installation of a new, engineered, three-coat system that will coat the structural metal 18 and extend its useful life significantly. Containment systems are often used to control 19 dust and overspray during blasting and coating installations. Some existing steel 20 structures may have previously been coated with lead-based paint systems. Under those 21 circumstances, the project activities are supplemented with lead abatement efforts to

1		contain, collect, and properly dispose of possible lead-based residuals and other efforts
2		to help protect workers and the environment.
3	34. Q.	What amount is the Company projecting for annual tank rehabilitation?
4	A.	The Company estimates its annual rehabilitation costs to be approximately \$9.3
5		million.
6	35. Q.	What factors are taken into consideration when determining this cost?
7	A.	The detailed tank inspections and subsequent report and recommendations will weigh
8		heavily in determining the actual tank rehabilitation needs and priorities. Further, the
9		various geographical differences in tank location, <i>i.e.</i> , tanks located along the coastal
10		regions may have a decreased coating life compared to a tank in more remote wooded
11		regions in the central part of the state.
12	36. Q.	Does the Company complete inspections and development of detailed plans and
13		specifications for the WSTR work on an annual basis?
14	A.	Yes, the Company performs inspections and has detailed plans and specifications
15		prepared for the work identified in the inspections every year. It is the foundation for
16		the tank rehabilitation program.
17	V.	THE RISKS OF FURNISHING WATER AND WASTEWATER SERVICES
18		A. Public Water Service
19	37. Q.	Please provide an overview of the risks associated with furnishing safe and
20		adequate water quantity and water quality and complying with drinking water

# and environmental regulations that apply to NJAWC's water supply facilities and operations.

3 A. Water supply utilities are subject to a complex array of regulations at the federal, state 4 and local levels with respect to water quantity, water quality and other environmental 5 aspects of their facilities and operations. NJAWC's surface water and groundwater 6 sources are subject to run off from upstream sources that can lead to possible 7 contamination and resulting treatment challenges such as cryptosporidium, PFAS, or 8 an unexpected chemical release upstream. These episodic challenges will continue to 9 face the Company, all while needing to meet the everyday requirements imposed by 10 programs administered by the NJDEP.

11 Drinking water quality is addressed by a combination of federal regulations established 12 under the SDWA coupled with state regulations and enforcement. The federal act 13 established the USEPA as the federal regulatory authority on drinking water. Under 14 that authority, USEPA has created standards for contaminant levels in drinking water 15 and a series of mandatory treatment method standards, coupled with monitoring and 16 reporting requirements, and public notification mandates in the event of contaminant 17 level or treatment method noncompliance. The USEPA has granted primacy to the 18 NJDEP, which administers the federal regulatory standards. In recent years there has 19 been an increase in public concern over water quality standards and regulation. This 20 increase has led to growth and increased stringency in USEPA and state drinking water 21 research and regulation.

1 The following is a brief summary of some of the key risk issues associated with current 2 and prospective regulation of water quantity, quality and other environmental aspects 3 of water supply system operations:

4 In addition to existing rules such as the Long Term 2 Enhanced Surface Water 5 Treatment Rule ("LT2ESWTR") and Stage 2 Disinfectants and Disinfection 6 Byproducts Rule ("Stage 2 DBPR") that continue to evolve, the Third Unregulated 7 Contaminant Monitoring Rule ("UCMR 3") is a rule published by the USEPA in 2012 8 that assesses the prevalence in water supplies of certain contaminants not currently 9 regulated under the SDWA. Certain contaminants have received particular scrutiny 10 under UCMR 3. These include perfluorooctanoic acid ("PFOA"), 1,4-dioxane, and 11 hexavalent chromium (VI)). PFOA is a perfluorinated compound ("PFC"), 12 a manmade chemical used in a variety of consumer products. PFOA is prevalent in 13 New Jersey, particularly in groundwater sources that have a history of contamination 14 from other VOCs. Previous studies have documented developmental effects from 15 PFOA including liver toxicity, kidney toxicity, immune effects, and cancer. Since the 16 UCMR 3 rule requirement, the NJDEP has enacted MCL levels for PNFA, PFOA, 17 PFOS<sup>4</sup>, at the following limits:

PFOA: 14 ng/L, or 0.014 μg/L
PFNA: 13 ng/L, or 0.014 μg/L
PFOS: 13 ng/L, or 0.014 μg/L

<sup>&</sup>lt;sup>4</sup> <u>https://www.nj.gov/dep/newsrel/2020/20\_0025.htm</u>

1	Prior to this regulation, PFOA had a health reference level established by the New
2	Jersey Drinking Water Quality Institute ("NJDWQI") of 40 ng/L. PFOA has been
3	detected in many system wells above the concentration of the NJDEP MCL. Several
4	wells in the Central Region had been found to have elevated levels of PFOA, including
5	Charles St, Quinton Ave, Green Brook, Rock Ave Piscataway, Clinton Ave,
6	Netherwood, Hummocks, and Springfield.
7	This NJDEP MCL promulgation for PFOA has had a significant impact on the
8	groundwater supply of NJAWC's systems. Regulation requires discontinued use of
9	affected wells or installation of treatment systems. Since the implementation of the new
10	limits, NJAWC has discontinued use of PFOA impacted wells at Greenbrook Station,
11	Charles Street Station, Quinton Ave. Station, Rock Avenue Station and Clinton Avenue
12	Station. Many of these stations were repurposed to act as boosters to move surface
13	water into the associated pressure gradients. The Company has mitigated the risks of a
14	system supply deficit which could compromise system integrity if not addressed
15	through its proactive efforts to discontinue the use of certain wells and/or install
16	effective treatment at others. Supply, capacity and distribution system improvements
17	were completed in order to comply with the regulation and to ensure adequate levels of
18	service are provided. As described within my testimony, there are several projects that
19	the Company has completed or will complete that address the PFOA (and broader
20	PFAS) issues throughout the state. Recent completions include Baltusrol Station, Short

1	Hills Station as well as Springfield Station and Hummocks Station. Treatment for the
2	Netherwood Station is planned and construction expected to start in late 2023. <sup>5</sup>
3	On March 14, 2023, <sup>6</sup> the USEPA issued proposed drinking water regulations for six
4	PFAS, which will establish legally enforceable levels (Maximum Contaminant Levels,
5	or "MCLs" and Maximum Contaminant Level Goals ("MCLGs")) for each of these six
6	PFAS that are known to occur in drinking water, all of which are more stringent than
7	those currently in place in New Jersey. In addition to the MCLs and enforceable limits
8	for these six PFAS, the USEPA is proposing requirements for the continued monitoring
9	of PFAS, public notification of monitoring results if they exceed defined limits, and
10	the treatment of drinking water to reduce PFAS to required limits. The USEPA is
11	expected to finalize its PFAS Rule in January 2024 at which point public water systems
12	will be required to modify their facilities to comply within three years.
13	For the Company, these new requirements will require investments of over \$500
14	million before the end of 2027, based on preliminary estimates; specific projects and
15	investments will depend on the results of monitoring and pilot testing as envisioned by
16	the regulations. Regarding 1,4-dioxane, the state of New Jersey is investigating the
17	regulation of this compound through the Drinking Water Quality institute. Recently the
18	DWQI recommended to the NJDEP that a MCL of 0.33 parts per billion ("ppb") be
19	approved by the NJDEP for implementation. During this time, NJAWC has actively

<sup>&</sup>lt;sup>5</sup> In the interim, these wells are not in use. Supply from the Raritan Millstone and Canal Road WTPs is available to serve customers in the region. This station is one of several groundwater stations used for resiliency in Central Region.

<sup>&</sup>lt;sup>6</sup> US EPA Fact Sheet – *EPA's Proposal to Limit PFAS in Drinking Water* https://www.epa.gov/system/files/documents/2023-04/Fact%20Sheet\_PFAS\_NPWDR\_Final\_4.4.23.pdf.

1	participated in monitoring both surface water and groundwater systems for 1,4-
2	dioxane. Advanced Oxidation treatment using peroxide and ultraviolet light is in place
3	at the Hummocks station (which also has PFAS removal equipment). Additionally, the
4	Company has completed the installation of treatment equipment for 1,4-dioxane at the
5	Delran WTP, in response to increased levels in the Delaware River. <sup>7</sup>
6	As the result of conditions that arose in Flint, Michigan and other jurisdictions across
7	the country, including Newark, increased scrutiny is being placed at all levels
8	concerning lead concentrations in water systems and the adoption <sup>8</sup> of more stringent
9	requirements under the federal Lead and Copper Rule. The lead issue typically arises
10	not from constituents in source water, but rather from the leaching of lead from older
11	pipes and joints into the water as it passes through household service lines and
12	plumbing. While providing centralized treatment that adjusts the pH can, in many
13	cases, help minimize lead corrosion, the fact is that the plumbing in many older
14	communities (including those in NJAWC's service territory) are older lead pipes or
15	contain the type of copper and galvanized pipes with solder joints where lead
16	contamination is an increased risk.

# 17

18

The USEPA recently issued and formally adopted Long Term Revisions to the Lead and Copper Rule ("LCR" or "Rule").<sup>9</sup> Generally, the revisions center around providing

<sup>&</sup>lt;sup>7</sup> https://www.nj.gov/dep/14-dioxane/

<sup>&</sup>lt;sup>8</sup> <u>https://www.epa.gov/newsreleases/epa-announces-intent-strengthen-lead-and-copper-regulations-support-proactive-lead.</u>

<sup>&</sup>lt;sup>9</sup> The EPA has also recently issued the Lead and Copper Rule Improvements Draft as of December 6, 2023, the requirements of which the Company is still evaluating. *See <u>https://www.epa.gov/ground-water-and-drinking-water/proposed-lead-and-copper-rule-improvements</u>.* 

1	for a more protective and enforceable health standard. Key areas that the revised Rule					
2	covers include more robust inventory management, strengthened corrosion control,					
3	treatment, increased sampling, and improved risk communication. The Rule as					
4	promulgated will impose significant additional capital investment requirements and					
5	increased operating expenses on all water systems. In addition, the New Jersey					
6	legislature has supplemented USEPA's recommendations with legislation					
7	(A5343/SS3398) that provides for more stringent inventory and lead line replacement					
8	requirements than the revised LCR ("NJ LSL Legislation"). <sup>10</sup>					
9	Most details of the changes to the Rule, as supplemented by the NJ LSL Legislation,					
-						
10	include the following:					
	<ul><li>include the following:</li><li>1. Identifying areas most impacted: this will require a lead line inventory for the first</li></ul>

<sup>&</sup>lt;sup>10</sup> See <u>https://www.asdwa.org/2021/07/26/nj-governor-signs-law-requiring-all-lead-service-lines-to-be-replaced-in-10-years/#:~:text=10%20Years%20%2D%20ASDWA-</u>,NJ%20Governor%20Signs%20Law%20Requiring%20All%20Lead%20Service,be%20Replaced%20in%2010

<sup>%20</sup>Years&text=Last%20Thursday%20(7%2F22),service%20lines%20within%2010%20years; see also https://nj.gov/governor/news/news/562021/approved/20210722a.shtml

1	3.	Replacing Lead Service Lines: The 10 ppb trigger would require the utility to work
2		with the state to set an annual goal of lead service line replacement so that a level
3		below the 10 ppb trigger could be achieved. Also, partial lead service line
4		replacements would not be allowed under the proposed Rule. The NJ LSL
5		Legislation requires all lead service lines to be removed within 10 years, including
6		galvanized lines.
7	4.	Increased Sampling Reliability: a new sampling techniques and selection criteria to
8		ensure the most at-risk communities receive the greatest sampling efforts.
9	5.	Improving Risk Communication: 24-hour notification of any action exceedance
10		levels, along with requiring systems to make the lead service line inventory publicly
11		available. There are also additional annual reporting requirements under NJ LSL
12		Legislation.
13	6.	Protecting Children in Schools: schools are required to sample and test schools and
14		day care facilities in a similar manner to public water systems. The NJ LSL
15		Legislation has additional requirements for schools and other community facilities.
16	In	addition to the items above, NJDEP has shared a few ideas with external stakeholders
17	th	rough various workshops and stakeholder meetings that suggest it is considering
18	ch	anges above and beyond the USEPA revised Rule as published. As of the date of this
19	WI	titing these changes are not yet formalized.

### **38. Q.** Are there any additional contaminant testing initiatives from USEPA?

A. Yes, in 2016, the USEPA issued the Fourth Unregulated Contaminant Monitoring Rule
 ("UCMR 4"), which required monitoring for 30 chemical contaminants<sup>11</sup> between 2018
 and 2020 using analytical methods developed by the USEPA and consensus
 organizations to provide a basis for future actions to help protect public health.

6 Following a successful UCMR4 sampling effort, NJAWC has used the resulting data 7 to direct current and future operational mitigations and projects. Specifically, the 8 Company has directed resources and expertise in expanding its utility-owned 9 laboratory cyanotoxin analytical capabilities. Cyanotoxins, especially microcystin, can 10 now be detected at levels far below what was previously possible. Our water quality 11 laboratory staff have trained and supported the efforts of the NJDEP and NJWSA for 12 drinking water reservoir monitoring and management. These capabilities have made 13 proactive WTP and reservoir management programs possible and have strengthened 14 the protection of public health for New Jersey drinking water customers. Disinfection 15 byproduct ("DBP") sampling results have highlighted the importance of balancing 16 strong surface water treatment programs, disinfection, and distribution system water 17 quality. Comprehensive programs are in place to manage DBP formation from source 18 water to customer taps.

<sup>&</sup>lt;sup>11</sup> The 30 chemical contaminants included 10 cyanotoxins (nine cyanotoxins and one cyanotoxin group) and 20 additional contaminants (two metals, eight pesticides plus one pesticide manufacturing byproduct, three brominated haloacetic acid ("HAA") disinfection byproducts groups, three alcohols, and three semivolatile organic chemicals ("SVOCs").

Most recently, the USEPA released the Final Fifth Unregulated Contaminant
Monitoring Rule ("UCMR 5"). <sup>12</sup> According to the USEPA,
UCMR 5 requires sample collection for 30 chemical contaminants between 2023 and
2025 using analytical methods developed by EPA and consensus organizations [].[ <sup>13</sup> ]
This action provides EPA and other interested parties with scientifically valid data on
the national occurrence of these contaminants in drinking water. Consistent with EPA's
PFAS Strategic Roadmap, UCMR 5 will provide new data that is critically needed to
improve [US]EPA's understanding of the frequency that 29 PFAS (and lithium) are
found in the nation's drinking water systems and at what levels. This data will ensure
science-based decision-making and help prioritize protection of disadvantaged
communities. <sup>14</sup>
The Company has executed and continues to execute this updated sampling plan and,
given its track record of implementing solutions for PFAS, plans to engage with
USEPA and the NJDEP in helping to provide solutions for providing treatment for
these compounds, particularly in light of the proposed USEPA limits for PFAS

19 annual average cost to manage the UCMR5 effort for very large systems to be \$2.2

compounds as discussed earlier in my testimony. Also, given the extensive work done

under prior UCMR efforts, the Company expects a significant level of increased

operational and capital outlays in future years. In fact, the USEPA has estimated the

16

17

<sup>&</sup>lt;sup>12</sup> <u>https://www.epa.gov/dwucmr/fifth-unregulated-contaminant-monitoring-rule</u>

<sup>&</sup>lt;sup>13</sup> Planning activities started in 2022, with final reporting expected to be completed in 2026 in accordance with the rule.

<sup>&</sup>lt;sup>14</sup> Id.

1	million. <sup>15</sup> This only includes the monitoring and analysis related to the UCMR5 CECs.
2	And now that USEPA (and NJDEP) has decided to implement new MCL's related to
3	these compounds, further expenses will ultimately be incurred for ongoing monitoring,
4	customer communication, and if needed, capital outlays for system improvements
5	needed to treat for these compounds. As noted by USEPA:
6	The public benefits from the information about whether or not unregulated
7	contaminants are present in their drinking water. If contaminants are not found,
8	consumer confidence in their drinking water should improve. If contaminants are
9	found, related health effects may be avoided when subsequent actions, such as
	1
10	regulations, are implemented, reducing or eliminating those contaminants. <sup>16</sup>

<sup>&</sup>lt;sup>15</sup> See Federal Register, Vol. 86, No. 245, p. 73135 (Dec. 27, 2021) available at https://www.govinfo.gov/content/pkg/FR-2021-12-27/pdf/2021-27858.pdf. <sup>16</sup> Id.

- regulations adopted in furtherance of setting standards for the construction and
   operation of sewer treatment systems.
   The significant risks associated with operating wastewater systems include the
- 4 following:

ng:

- Effluent limitations imposed on wastewater treatment plant discharges are stringent and
  can become more stringent over time. The Clean Water Act requires wastewater
  systems to obtain and comply with National Pollutant Discharge Elimination System
  ("NPDES") permits, which, in New Jersey, are issued and enforced by the NJDEP.
  These NPDES permits establish stringent effluent limits based upon the stricter of: (1)
  technology-based effluent limits; and (2) water quality based effluent limits.
- 11 Several NJAWC treatment plants, including the Homestead wastewater treatment plant 12 ("WWTP") and the Long Hill WWTP face more stringent effluent limits for a series of 13 parameters, particularly lowering ammonia and phosphorous limits due to 14 classification of the receiving stream. Additionally, PFAS effluent discharge limits for 15 WWTP permit holders (owners such as NJAWC) are being considered at both the 16 federal and state level. There is also consideration at the federal and state levels for 17 limits on PFAS in sewage plant residuals (sludge) that, if adopted, will ultimately 18 require extensive capital equipment treatment outlays with associated increased operational expense<sup>17</sup>. 19

<sup>&</sup>lt;sup>17</sup> <u>https://www.epa.gov/newsreleases/epa-announces-plans-wastewater-regulations-and-studies-including-limits-pfas-new-study</u>.

More stringent effluent limits may be imposed when technology evolves or stream conditions and discharge requirements change, engendering requirements for significant capital improvements and/or increased operating costs for enhanced treatment performance. Every 3-5 years, NPDES permits are up for renewal, and in any such renewal, more stringent limits may be triggered.

6 Other potential liability risks from wastewater system operations arise from backups, 7 overflows or releases that may occur from the collection system onto private property 8 or into the environment. The Company has deployed level sensing and alarming 9 technology (Telog and SmartCover) which provide effective monitoring for optimized 10 cleaning to help prevent such backups and potential overflows. As an example, some 11 wastewater system operators have been confronted with claims under the federal 12 Comprehensive Environmental Response, Compensation and Liability Act 13 ("CERCLA") for cleanup of contamination that occurred when wastewater containing 14 "hazardous substances" leaked from wastewater lines into soils or groundwater. While 15 not as extreme, liabilities resulting from wastewater backups into buildings or other 16 unplanned discharges are an inherent part of wastewater system risks.

17

### C. Climate Variability

# 40. Q. Does climate variability pose additional risk for water supply utilities such as NJAWC?

A. Yes. Whatever the debate may be concerning the causes of climate variability, water supply utilities face the reality of climatic variability and attendant stresses on water resources and system recovery. The recent trend in precipitation not only in New

1	Jersey <sup>18</sup> but also throughout Northeastern United States has been towards increases in
2	rainfall intensity and rainfall is also projected to increase in amount and persistence in
3	addition to intensity. <sup>19</sup> That means we can expect more intense high-precipitation
4	events, river and coastal floods, along with high damaging storm events – which impact
5	water utilities. In addition, these climate-related disruptions will exacerbate existing
6	aging infrastructure issues experienced by water utilities. <sup>20</sup>
7	Recently the remnants of Hurricane Ida devastated much of Central New Jersey. <sup>21</sup> The
8	storm claimed five lives and resulted in millions of dollars in property damage.
9	Fortunately, the Company completed a \$35 million improvement in the RMWTP's
10	floodwall system back in 2018 and as a result of these improvements was able to sustain
11	safe, reliable service throughout the storm event. Additionally, the Company also
12	upgraded its backup generator system which provided uninterrupted power during the
13	event (even though utility side power was interrupted). Had these improvements not
14	been made, hundreds of thousands of customers would have been without safe, reliable
15	water during this event. <sup>22</sup> These investments demonstrated clearly the wisdom and

EMAIL CAMPAIGN 2021 09 09 11 48&utm medium=email&utm term=0 6732b2b110-b8a2a59891-44402630

1 prudence of the Company's focus on reducing risk and maintaining safe and reliable 2 service to its customers. Water supply systems are fundamentally resource-dependent 3 and, therefore, the effects of climate variability pose a significant on-going risk and 4 create challenges with regard to maintaining a reliable water supply during the full 5 range of potential future conditions, including even what might be assumed to be 6 "normal" periods. The safe yields of water supply sources have historically been 7 evaluated based on historical climatic patterns, data from so called "droughts of record" 8 or dry period frequency analysis. Changing climatic conditions, however, suggest that 9 historical hydrologic data (which in many cases only reflect 50-100 years of rainfall 10 and stream flow measurement collection – a quite short period in geologic or climatic 11 time) may not accurately predict future conditions. Thus, the calculated safe yield of 12 streams, reservoirs and groundwater wells are put in question as the effects of climate 13 variability are experienced across the southeastern United States. Thus, in response to 14 climate variability, water supply systems must address the risks posed to the reliability 15 and resilience of their sources. While droughts are the major challenge for water supply 16 systems, heavy precipitation and high-flow events are the concern of wastewater 17 systems.

18 The effects of climate variability impact the resiliency of a system to withstand an event 19 without disrupting service to customers or, if service is interrupted, to restore the 20 service in a timely manner. Like all large users dependent on electricity from the grid, 21 water utilities must plan for power outages and develop plans for maintaining 22 continuity of operations when such outages occur. Nonetheless, recent weather patterns

1 combined with the issue of aging infrastructure are causing utilities to review 2 traditional planning and design criteria. The design standards for supplies, treatment 3 plants, pump stations and tanks are taken together to achieve a level of zero service 4 outages. The so-called new normal has led experts to look beyond traditional reliability 5 and emergency planning into a world that needs the speed of recovery and resiliency 6 for much more widespread and damaging events. Updating infrastructure to keep up 7 with the increase in extreme weather and ensuring that adequate service can be 8 maintained for extended time periods after an extreme event is just as important as 9 addressing the aging infrastructure.

10 The Company looks for ways to reduce or mitigate increases in expense in many areas 11 of the business, which also has an environmental benefit. Examples such as increased 12 leak detection allow for more efficient routing of repair crews to the highest priority 13 leaks. Controlling leaks before they create larger issues results in less fuel usage, and 14 minimizes excavation and repair materials; not to mention inconvenience to customers 15 from interruptions in service, detours, etc. This proactive approach of deploying active 16 leak detection not only minimizes treatment exposure but also helps preserve source 17 water; every gallon that is saved is a gallon that can be provided at a later date, 18 particularly during times of drought.

In addition, NJAWC has and will continue to evaluate its systems and systematically
look for opportunities to add additional standby power capacity, look for ways to
diversify its fuel supply and review and implement various other projects to minimize
its potential impact to climate change.

# 1 **41. Q. Does this conclude your Direct Testimony?**

2 A. Yes, it does.

### Appendix A

### **1 1. Q.** Please describe your educational background and professional associations.

A. I earned a Bachelor of Mechanical Engineering degree (1991) from Villanova
University, Villanova, Pa. I am a registered Professional Engineer in the State of New
Jersey and am currently licensed in an inactive status in multiple states including
Pennsylvania, Ohio, New York, Missouri, Maryland, and Delaware.

### 6 2. Q. What has been your business experience?

A. I have over twenty-six years of experience in the water and wastewater utility
engineering field. From 1991 to 2001, I was employed by the Bergen County Utilities
Authority ("BCUA") in various engineering positions of increasing responsibility
including, Assistant Engineer and Senior Environmental Engineer where I designed,
managed, and commissioned multi-disciplined wastewater infrastructure projects. I led
projects that were focused on operational efficiency and data collection along with
significant plant and collection system improvements. Some examples include:

14

• Upgrade of all of the BCUA's open channel flow metering equipment.

- Management of permitted overflow level monitoring
- Replacement of 42" PCCP Force Main
- Rehabilitation of 12" Gravity sewers with fold and form lining technology
- Treatment plant additions including addition of Sludge thickening centrifuge and
   associated equipment; polymer feeds, electrical equipment and controls
- Replacement of Waste Activated Sludge Pumping System

### Appendix A

1 From 2001 through 2011 I was employed by Applied Water Management Inc. 2 ("AWM"), where I worked in various positions of increasing responsibility from staff 3 engineer to Design Build Director (Company Officer). I also held a position of Officer 4 and Director on the Board of Applied Wastewater Management, Inc. ("AWWM"), a 5 New Jersey Board of Public Utilities ("BPU" or "Board") -regulated subsidiary of 6 AWM. Much of my experience at AWM was in design construction and operations of 7 small, decentralized water and wastewater treatment facilities. My work included 8 responsibility for complete design, construction and facility commissioning for 9 Integrated Biological Membrane Filtration Plants for sewage treatment and discharge 10 to ground water. These plants were designed for strict groundwater discharge limits 11 (Nitrogen) and allowed for a high degree of automation for continuous unattended 12 operation. Water systems design and construction included well stations with treatment 13 (air stripping, disinfection) and distribution equipment (hydro pneumatic tanks, 14 pumping systems, fire flow systems).

AWM was a subsidiary company of American Water Works Company, Inc. ("AWW") until 2011. Upon the completion of the sale of AWM in December 2011, I took a position with AWW as an engineer with the American Water Works Service Company, Inc. ("AWWSC"). I held a Director of Engineering position, primarily supporting business development activities as a technical expert. I also provided engineering support and leadership for various strategic initiatives including wastewater growth opportunities and water/wastewater system planning and infrastructure renewal. In

# Appendix A

- 1 January of 2014 I was appointed to the position of Vice President Engineering for
- 2 NJAWC which position I held until being appointed to my current position as Vice
- 3 President of Engineering for the Eastern Division in September of 2019.
