Re: Energy Strong II Program Quarterly Report Q4 - 2023

Dear Secretary Golden:

Enclosed for filing is the report on the second quarter of the Energy Strong II program for October to December, 2023.

The Energy Strong II program was addressed by a Board Order dated September 11, 2019 September 11 Order) in Docket Nos. EO18060629 & GO18060630. That order adopted a Stipulation pursuant to which PSE&G is operating the program known as Energy Strong II.

Paragraph 45 of that Stipulation requires reports on:

- the estimated quantity of work and the quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. design phase, material procurement, permit gathering, phases of construction;
- the forecasted and actual Energy Strong II costs-to-date for the quarterly reporting period and for the program-to-date; where projects are identified by major category (with actual variances from forecasted amounts expressed in dollar and percentage terms);
- the estimated Energy Strong II project completion date, and estimated completion dates for each Energy Strong II sub-program and the Program as a whole;
- Anticipated changes to ES II projects, if any;
- Actual capital expenditures made in the normal course of business on similar projects, identified by comparable Energy Strong II sub-program; and
- Any other performance metrics concerning the IIP required by the Board.

The reporting requirements listed in paragraph 45 of the Stipulation are addressed by the enclosed materials.

Paragraphs 46, 47, and 49 of that Stipulation provide that PSE&G shall report quarterly on the performance of Electric Stations and gas M&R Stations; Contingency Reconfiguration Strategies and Grid Modernization ADMS in a manner that compares the performance of the upgraded or new plant to pre-Energy Strong II Plant.

Please contact the undersigned with any questions or concerns.

Very truly yours,

Danielle Lopez

ES II Program Quarterly Report to the Board of Public Utilities

Q4-2023: October - December 2023

Table of Contents

Metric 1 – Estimated Quantity of Work

For each Energy Strong II Subprogram:

A. Estimated quantity of work

i. **For the subprogram**

ii. **Planned to date (based on forecasted estimates at the beginning of the reporting period)**

B. Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g., design phase, material procurement, permit gathering, phases of construction.

NOTE: This quarterly report covers Program to date performance up to the Q4-2023 period – October 1, 2023, through December 31, 2023. Where applicable, forecasted, and actual units of work and/or major tasks completed are provided.

At the end of Q4-2023, which coincides with the end of the ES II Program Period, the work under all subprograms/projects have progressed through planning, authorization and execution and are mostly in the final stages of completion. The Program work is over ninety percent complete. Of the five subprograms in the Electric Program, three have substantially achieved their planned scope, two have less than ten percent of work remaining. For the Gas M&R Program, five of the six stations are substantially complete, and one is in advanced stage of construction.

Energy Strong II Electric Program

Electric Station Flood Mitigation

A. Estimated Quantity of Work:

i. **Subprogram Scope:** The estimated quantity of work for this Subprogram includes implementation of flood mitigation (FM) measures at 16 Substations. The Stipulation also allows for inclusion of substation switchgear Life Cycle (LC) replacement, subject to funding available within the Flood Mitigation budget cap.

In 2021, the Front St substation was initially included in the program as a Lifecycle (LC) station, as identified in the list of LC stations identified in the stipulation. This station was added into the subprogram as a Lifecycle replacement project for potential funding however, during the project initiation, it was determined that in addition to life cycle improvements, Front St. station also required flood mitigation as it is located within a current FEMA mapping flood zone and below the NJ DEP flood Hazard area elevation.

One (1) project (Constable Hook) will be included in the execution of another transmission project and has been removed from the ESII Program. The Energy Strong II Electric Stations Flood Mitigation subprogram scope was amended in Company's November 2021 accelerated recovery filing to reflect the exclusion of Constable Hook and inclusion of Front St. as replacement.

Constable Hook is not included in the updates below.

ii. **Planned to Date:** Major work planned to the end of December 2023 (Front St included):

a. Completion of Key Drawing Review (KDR) for all 16 FM stations,
b. Transitioned from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates for all 16 stations.
c. Issue Switchgear purchase orders for 14 flood stations (raise & rebuild stations).
d. Detailed Engineering on 16 flood stations.
e. Obtain Site Plan approvals required for 10 flood stations.
f. 12 ESFM projects in active construction.
g. Switchgear installation at 14 flood stations (raise & rebuild stations).
h. Elimination of Ridgefield and Market St 4kV stations and completion of associated circuit conversion from 4kV to 13kv.
i. Commissioning and In-service of new raised switchgear at 14 flood stations (raise & rebuild stations).
j. Close out Ridgefield 4kV and Market Street Elimination projects

B. Quantity of Work Completed to Date:

As of the end of December 2023 most projects in the ESFM program progressed on schedule. During Q4-2023, five stations - Lakeside, Orange Valley, Woodlynne, Waverly 4kV, and Front St all placed their switchgear in service. Program to date, 14 projects (Academy, Leonia, Ridgefield 13kV, Hasbrouck Heights, Kingsland, State St, Waverly, Toney's Brook, Clay St, Meadow Rd, Lakeside, Woodlynne, Orange Valley and Front St.) have placed switchgears into service. To date the Ridgefield 4kV and Market St Elimination projects completed their 4kV to 13kV conversions, and transfer of customers from Ridgefield and Market St 4kV Substations.

- All 16 projects in the Flood Mitigation subprogram have transitioned from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates.

- Purchase Orders have been awarded for major equipment (switchgear) on all 14 projects requiring switchgear.
- 16 projects have completed detailed engineering design.
- 9 projects have awarded POs for A/E design. (PSE&G is the engineer for the other 7 projects.)
- 16 projects have completed scope lockdown.
- 16 projects have awarded purchase orders for civil construction.
- 15 projects have awarded a purchase order for electrical construction.
- Required Site Plan approval received for 10 projects.
- 12 projects (Leonia, State St, Clay St, Waverly, Front St, Meadow Road, Kingsland, Lakeside, Toney's Brook, Orange Valley, Woodlynne and Hasbrouck Heights) continue in construction. Four projects are completed with construction (Market St, Academy, Ridgefield 4kV and Ridgefield 13kV). Two projects are complete with closeout (Market St. and Ridgefield 4kV).
- Leonia has successfully energized new 13kV switchgear #1 and #2 and placed it into service. All circuits on both switchgears have been cutover to the new switchgears.
- Ridgefield has successfully energized new 13kV switchgear #1 and #2 and placed it into service. All circuits on both switchgears have been cutover to the new switchgears.
- Waverly has successfully energized the 26kV and 4kV switchgears and placed them into service. All 26kV circuits have been cutover to the new switchgear.
- Hasbrouck Heights has successfully energized new 4kV switchgear and placed it into service. All circuits have been cutover to the new switchgear.
- Academy has successfully energized the new 13kV switchgear and placed it into service at the new Fairmont station. All circuits from the Academy station have been upgraded from 4kV to 13kV and transferred to the new Fairmont station.
- Toney's Brook has successfully energized the new 4kV switchgear and placed it into service. All Circuits have been cutover to the new switchgear.
- The 13kV Contingency switchgear from Leonia was disassembled and delivered and installed and placed in-service as permanent raised 13kV switchgear at Meadow Road. All circuits have been cutover to the new switchgear.
- The 4kV switchgear at Front St. has been energized and placed in-service.
- State St. energized the new 4kV switchgear and placed it in-service.
- Clay St. energized the new 4kV switchgear and placed it in-service.

- The 13kV Contingency switchgear from Ridgefield was disassembled and delivered, installed, and placed in-service as permanent raised 13kV switchgear at Kingsland.
- The Ridgefield 4kV and Market St Elimination projects completed the 4kV to 13kV conversions, thereby mitigating the flood risk to customers previously supplied from Ridgefield and Market St 4kV Substations. Both station elimination projects are complete.
- Market St has completed inside plant (substation) civil demolition and ISRA related activities.
- Project closeout completed for Ridgefield 4kV Elimination and Market St Elimination.

Electric Contingency Reconfiguration (CR)

A. Estimated Quantity of Work:

i. **Subprogram Scope:** Install 1,467 new reclosers to increase the number of sections in the present loop designs, adding redundancy within each loop scheme. The work includes installing additional feeder reclosers to traditional 13kV loops; install new reclosers on 4kV circuits and install new branch reclosers. By having more sections in loop schemes and/or more circuit ties, fewer customers should be interrupted when damage occurs in a specific section of the loop. The scope also includes installation of 1,348 single phase reclosing devices (Fuse Savers) at fuse locations on single phase branch circuits.

ii. **Planned to Date:** Major work planned for the CR subprogram to the end of December 2023 included the following.

a. Install 1,467 Reclosers program to date (PTD) by end of Q3-2022
b. Commission 1,467 Reclosers PTD by the end of Q3-2023
c. Install and commission 1,348 Fuse Saver program to date (PTD) by end of Q3-2023

B. Quantity of Work Completed to Date:

Reclosers

- All 1,467 Reclosers planned for the Program have been engineered, installed, and commissioned into service as of Q3-2022.

Fuse Savers

- All 1,348 Fuse Savers planned for the Program have been installed as of as of Q3-2023.
- 1,347 of the 1,348 installed Fuse Savers were commissioned into service by end of Q3-2023.

Electric Grid Modernization - Communication System

A. Estimated Quantity of Work:

i. **Subprogram Scope:** Install a communication system upgrade, comprised of a new Wireless Radio Network and New fiber installations. The wireless communication component includes a new Wireless Radio Network service (FirstNet), installation of approximately 5,000 new radios covering all existing reclosers, new reclosers and fuses savers installed under the ES II program, as well as 218 substation RTU's. Also included is a Remote Device Management System (RDM) installed on all reclosers on the system using Blueframe Software. The New Fiber Installation scope provides new fiber connection to 26 electric substations and 8 operations locations, and cutover SCADA system communications at 12 substations to the existing fiber network.

ii. Work Planned to Date: Major work planned to the end of December 2023 included the following:

a. Establish new Wireless Network.
b. Retrofit 2,318 existing reclosers with wireless on the new wireless network.
c. Install wireless radios in 1,467 new Reclosers.
d. Install wireless radios in 1,348 new Fuse Savers
e. Develop Cutover Process and completed cutover 3,896 Reclosers on distribution circuits across all four operating divisions to the Blue Frame RDM system.
f. Build and Install Blueframe Software for RDM.
g. Develop Process to Prepare for RDM Cutover.
h. Complete installation and place in-service new fiber connection installations at 26 substations and 8 Company operations locations.
i. Complete cutover of SCADA communication to existing fiber connection at 12 substations.

B. Quantity of Work Completed to Date:

- Established new Wireless Network.
- Retrofitted 2,318 existing reclosers with radios on the new wireless network (completed December 2021).
- Installed wireless radios in 1,467 new reclosers (completed January 2022).
- Installed wireless radios in 1,347 new Fuse Savers (as of December 2023).

- Built and Installed Blueframe Software to provide remote device monitoring (RDM) of Reclosers.
- Develop Cutover Process and completed cutover 3,683 reclosers on distribution circuits across all four operating divisions to the Blueframe RDM system.
- Complete installation and place in-service new fiber connection installations at 26 substations and 8 Company operations locations.
- Completed cutover of SCADA communication to existing fiber connection at 12 substations.

Electric Grid Modernization - ADMS

A. Estimated Quantity of Work:

i. **Project:** The Advanced Distribution Management System (ADMS) subprogram is made up of Supervisory Control and Data Acquisition (SCADA) Platform Upgrade; new Outage Management System (OMS); deployment of additional modules of Distribution Management System (DMS) and Distributed Energy Resources Management System (DERMS) Applications. This remains unchanged from the beginning of the Energy Strong II Program.

ii. **Planned to Date:** Major work planned to the end of December 2023 included the following:

a. SCADA Platform Upgrade – Complete requirements definition; design; procurement; testing and defects/variances correction, and "go-live" to production of SCADA Platform Upgrade (to facilitate completion of DMS/DERMS and OMS)

b. DMS/DERMS - Complete requirements definition; design; procurement; testing and defects/variances correction, user training, and "go-live" to production.

c. Outage Management System (OMS):

- Complete requirements definition; design (architecture and interfaces); procurement.
- Complete Site Acceptance Testing (SAT), Site Integration Testing (SIT) and User Acceptance Testing (UAT)
- Defects/variances correction and remediation.
- Organizational Change Management and user training
- Place new OMS system (QAS/Production/Disaster Recovery) in production ("go-live").

d. Complete SIT Round 5

e. Begin SIT Planning 6 and 7.

B. Quantity of Work Completed to Date:

a. SCADA Platform Upgrade:

- Completed requirements definition; design; procurement; installation; testing and defects/variances correction, and placed SCADA Platform Upgrade in-service (“go-live”) - Achieved Jun’2022.
- Completed user training.
- Completed retirement and removal of existing Platform Quality Assurance and Production systems.
- Completed post go-live hyper-care and project close.

b. DMS/DERMS:

- Completed requirements definition; design; procurement; installation; testing and defects/variances correction, and “go-live” to production. (Achieved January 2023).
- Completed user training.
- Completed post go-live hyper care and project financial close.

c. Outage Management System (OMS):

- Complete requirements definition; design (architecture and interfaces); procurement, and installation
- Complete Site Acceptance Testing (SAT), Site Integration Testing (SIT) and User Acceptance Testing (UAT)
- Continued correction and remediation of variances.
- Organizational Change Management and user training
- Place new OMS system (QAS/Production/Disaster Recovery) in production (“go-live”).
- Completed SIT 5, 6 & 7
- Installed 10 Compass mobile application software upgrades (2.0.10 to 2.0.19)
- Continued organizational change management, product demonstrations, and training material development.

Electric Stipulated Base Subprogram

A. Estimated Quantity of Work:

i. **Subprogram scope:** The scope of Electric Stipulated Base includes upgrading selected distribution circuits by replacing existing open wire with spacer cable conductors utilizing outside plant higher design and construction standards ("Outside Plant" or OP-HDS) and electric 4kV substations switchgear life cycle replacement at 4 stations. Also included are the installation new underground distribution circuits (State St. OP project), which is part of the State St. Flood Mitigation project scope, as noted in Company's Accelerated Recovery filings.

ii. **Planned to Date:** Major work planned to the end of December 2023 included:

a. Completion of IP Key Drawing Review (KDR) for the four LC stations; cost estimate update to Study Level (50% confidence level) transition approval for 5 station projects (including State St. OP), estimate update to Conceptual (70% CL) level estimate transition for 4 projects and estimate update to Definitive (90% CL) level estimate for 4 stations.
b. Issuance of Switchgear purchase orders for the 4 IP Lifecycle stations.
c. A/E contract awards for all Lifecycle stations.
d. Detailed design for all 4 IP Lifecycle stations and the State St OP Project.
e. Approval of Site Plan applications for all four (4) IP Lifecycle stations.
f. Complete civil construction at all Lifecycle stations.
g. Complete electrical construction at all Lifecycle stations.
h. Installation of contingency switchgear and phased temporary transfer of distribution circuits, removal of contingency switchgear after connection of all existing circuits to new switchgear with all existing.
i. Removal of existing feeder rows (switchgear) and demolition of foundations
j. Installation, commissioning, and in-service of new raised 4kv switchgear at all four (4) Lifecycle stations.
k. Complete cutover of new and existing circuits to the new switchgear at Plainfield, Paramus, and Hamilton. Cutover first circuit at Woodbury.
l. Removal of existing feeder rows (old switchgear) at Plainfield, Paramus, and Hamilton.

B. Quantity of work Completed to Date:

- As of the end of December 2023, Key Drawing Review (KDR), estimate update to Definitive 90% level and URB estimate transition have been completed for all Lifecycle stations.
- Four electric 4kV life cycle substation projects (Plainfield, Paramus, Hamilton, & Woodbury) have awarded major equipment PO's.
- Four electric 4kV life cycle substation projects (Plainfield, Paramus, Hamilton, & Woodbury) and the State St OP project have substantially completed detailed engineering design and locked their scopes.
- Site plan applications have been approved on all four IP electric 4kV life cycle substation projects.
- All life cycle substation projects are in civil construction.
- All life cycle substation projects are in electrical construction.
- Paramus 4kV substations life cycle project contingency switchgear is in-service.
- Hamilton, Paramus, and Plainfield have set and energized their new 4kV switchgears and placed them into service.
- Hamilton, Paramus, and Plainfield completed all circuit cutovers.
- State St OP has placed the first OP circuit into service from the New State St substation.

Energy Strong II Gas M&R

A. Estimated Quantity of work:

i. **Subprogram Scope:** The estimated quantity of work for this subprogram includes implementation of flood mitigation measures at 2 of the 6 Gas M&R Substations (Camden and East Rutherford) listed in the Program Stipulation and life cycle upgrades at all 6 M&R Substations (Camden, Central, East Rutherford, Mt. Laurel, Paramus, and Westampton). This remains unchanged from the beginning of the Energy Strong II Program.

ii. **Planned to Date:** Major work planned to the end of December 2023 included:

A. <u>Camden</u>

a. Complete project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates.

b. Bid and award contracts for engineering and procurement services.
c. Prepare all necessary permit packages for dewatering, soil conservation, Site Plan County approvals, submit applications and obtain all required permits.
d. Through AE procurement, bid and award contracts, and receive delivery for supply of major materials and equipment – (Heater, buildings, piping, Skids, and other materials).
e. Negotiate and finalize Interconnection Agreement with Transco for Camden.
f. Bid and award construction contracts.
g. Construct/install and fit out equipment buildings (control/heater/chromatography, Regulator Building, equipment platforms, pipe racks).
h. Install piping and instrumentation.
i. Commission M&R regulating equipment and place in service. Commission LPA vaporizers LPA system and place LPA system in-service.
j. Complete asbestos remediation and demolition of replaced buildings and removal of abandoned piping.
k. Demobilize from the site.
l. Preparation of as-built drawings and turnover package.

B. <u>East Rutherford</u>

a. Complete project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates.
b. Bid and award contracts for engineering and procurement services.
c. Prepare all necessary permit packages for waterfront development, Meadowlands Commission, dewatering, soil conservation, Site Plan, county approvals, submit applications and obtain all required permits.
d. Through AE procurement, bid and award contracts, and receive delivery for supply of major materials and equipment – (Heater, buildings, piping, Skids, and other materials
e. Negotiate and finalize Interconnection Agreements with Transco at East Rutherford.
f. Acquire land rights (for laydown area lease for material storage yards)
g. Bid and award construction contracts.

h. Install bypass skids.
i. Complete asbestos remediation and demolition of existing buildings and removal of abandoned piping.
j. Drive piles and Construct/install and fit out equipment buildings (control/heater/chromatography, Regulator Building, equipment platforms, heaters, scrubbers)
k. Install piping and instrumentation.
l. Commission M&R regulating equipment and place in service.
m. Demobilize from the site.
n. Restore laydown area.
o. Continue resolution of punch list items.
p. Continue updating “As-Built” drawings and preparation of turnover package.

C. <u>Central</u>

a. Complete project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates.
b. Bid and award contracts for engineering procurement.
c. Prepare all necessary permit packages for dewatering, soil conservation, Title-V air permit, Site Plan County approvals; submit applications and obtain all required permits.
d. Through AE procurement services, bid and award contracts, and receive delivery for supply of major materials and equipment – (Heater, buildings, piping, Skids, and other materials)
e. Negotiate and finalize Interconnection Agreements with Transco and Enbridge at Central.
f. Bid and award construction contracts.
g. Construct/install and fit out equipment buildings (control/heater/chromatography, Regulator Building, flow control building, equipment platforms, pipe racks)
h. Install piping and instrumentation.

i. Commission M&R regulating equipment and place in service. Commission LPA vaporizers LPA system and place LPA system in-service.
j. Complete asbestos remediation and demolition of replaced buildings and removal of abandoned piping.
k. Complete site restoration.
l. Demobilize contractors from the site.
m. Develop punch list.
n. Begin preparing as-built drawings and turnover package.

D. Mount Laurel

a. Complete project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates.
b. Bid and award contracts for engineering and procurement services.
c. Prepare all necessary permit packages for dewatering, soil conservation, Site Plan, county approvals. Submit applications and obtain all required permits.
d. Through AE procurement, bid and award contracts, and receive delivery of major materials and equipment – (Heater, buildings, piping, Skids, other materials)
e. Negotiate and finalize Interconnection Agreements with Transco at Mt. Laurel.
f. Acquire required land rights.
g. Bid and award construction contracts.
h. Complete asbestos remediation and demolition of existing buildings and removal of abandoned piping.
i. Construct/install and fit out equipment buildings (control/heater/chromatography, Regulator Building, scrubbers).
j. Install bypass skids.
k. Install piping and instrumentation.
l. Complete all mechanical, civil, electrical, and instrumentation work.
m. Commission all systems.
n. Place station in service.
o. Begin demobilization.

p. Develop punch list.

q. Begin preparing “as-built” drawings and turnover packages.

E. <u>Paramus</u>

a. Complete project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to level estimates.

b. Bid and award contracts for engineering and procurement services.

c. Prepare all necessary permit packages for dewatering, soil conservation, Site Plan, county approvals, submit applications and obtain all required permits.

d. Through AE procurement, bid and award contracts, and receive delivery for supply of major materials and equipment – (Heater, buildings, piping, Skids, other materials).

e. Negotiate and finalize Interconnection Agreements with Transco at Paramus.

f. Bid and award construction contracts.

g. Install bypass skids.

h. Complete asbestos remediation and demolition of existing buildings and removal of abandoned piping.

i. Construct/install and fit out equipment buildings (control/heater/chromatography, Regulator Building, scrubbers).

j. Install piping and instrumentation.

k. Continue to receive materials and equipment.

l. Complete fabrication of contingency bypass skids.

m. Tie in, commission and place in service contingency bypass skids.

n. Take Paramus station out of service.

o. Continue fabrication of piping segments.

F. <u>Westampton</u>

a. Complete project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to level estimates.

b. Bid and award contracts for engineering services (AEs) and procurement.

c. Prepare all necessary permit packages for dewatering, soil conservation, Site Plan, county approvals, submit applications and obtain all required permits.
d. Through AE procurement, bid and award contracts, and receive delivery for supply of major materials and equipment – (buildings, piping, scrubber, other materials)
e. Negotiate and finalize Interconnection Agreements with Transco.
f. Acquire lease for material storage yards and other required land rights for
g. Bid and award construction contracts.
h. Complete asbestos remediation and demolition of existing buildings and removal of abandoned piping.
i. Construct/install and fit out equipment buildings (control/heater/chromatography, Regulator Building, equipment platforms, scrubbers)
j. Install piping and instrumentation.
k. Commission M&R regulating equipment and place in service.
l. Demobilize from the site.
m. Restore laydown area.
n. Working down punch-list items.
o. Work on As-Builts and turnover package.

B. Quantity of Work Completed to Date:

Major work completed as to the end of December 2023 includes the following:

<u>Camden</u>

- Completed project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates.
- Awarded contracts for engineering and procurement services (AE) to Burns & McDonnell
- Prepared all required permit packages, submitted applications, and obtained all required permits.
- awarded contracts, and received delivery of major materials and equipment – (Heater, buildings, piping, Skids, other materials)
- Finalized Interconnection Agreements with Transco.
- Awarded construction contract to Henkels and McCoy.
- Constructed/installed and fit out equipment buildings pipe racks and equipment platforms.
- Installed all piping and instrumentation.
- Commissioned LPA vaporizers and LPA system.

- Completed all remaining hazardous materials abatement and demolition of buildings and piping.
- Began demobilization from the site.
- Commenced compiling all data for turnover package.
- Started preparation of "as-built" drawings.

East Rutherford

- Completed project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates.
- Awarded contracts for engineering and procurement services (AE) to Entrust Engineering.
- Prepared all required permit packages. Submitted applications and obtained all required permits.
- awarded contracts, and received delivery of major materials and equipment – (Heater, buildings, piping, Skids, and other material)
- Finalized Interconnection Agreements with Transco.
- Awarded construction contract to J Fletcher Creamer.
- Installed contingency bypass skids.
- Abated and demolished buildings and yard piping.
- Constructed/installed and fitted out equipment building, control building, and equipment platforms.
- Installed all piping and instrumentation.
- Commissioned system.
- Demobilization from the site.
- Completed final site restoration.
- Continued resolution of open punch list items.
- Continued working on completion of "as-built" drawings.

Central

- Completed project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates.
- Awarded contracts for engineering services (AE) to Odin Engineering and to Burns & McDonnell for procurement.
- Prepared all required permit packages, submitted applications, and obtained all required permits.
- awarded contracts, and received delivery of major materials and equipment – (Heater, buildings, piping, Skids, other materials)
- Finalized Interconnection Agreements with Transco and Enbridge.
- Awarded construction contract to Henkels & McCoy.
- Constructed/installed and fitted out equipment building, control building, pipe racks, and equipment platforms.
- Installed all piping and instrumentation.
- Commissioned system.
- Completed demolition of buildings and abandoned piping.

- Completed site restoration.
- Completed demobilization of the site.
- Began compiling all data for turnover package.
- Started preparation of “as-built” drawings.
- Developed project punch list.

Mt. Laurel

- Completed project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates.
- Awarded contracts for engineering and procurement services (AE) to Kiely Engineering.
- Prepared all required permit packages, submitted applications, and obtained all required permits.
- Awarded contracts, and received delivery of major materials and equipment – (Heater, buildings, piping, Skids, other materials)
- Finalized Interconnection Agreement with Transco.
- Awarded construction contract to Henkels & McCoy.
- Installed contingency bypass skids.
- Abated and demolished buildings and yard piping.
- Constructed/installed and fit out equipment building, control building, and equipment platforms.
- Installed all piping and instrumentation.
- Completed installation of electrical conduits.
- Completed installation of below grade piping runs, inlet and outlet piping regulating runs.
- Completed wiring of SCADA building.
- Completed erection of regulation building.
- Commissioned all systems.
- Put Mt. Laurel station in service.
- Began decommissioning temporary bypass skid.

Paramus

- Completed project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) level estimates.
- Awarded contracts for engineering and procurement services (AE) to Entrust Engineering.
- Prepared all required permit packages. Submitted applications and obtained all required permits.
- awarded contracts and received delivery of major materials and equipment – (Heater, buildings, piping, Skids, other materials).
- Finalized Interconnection Agreement with Transco.
- Awarded construction contract to Furino and Sons.
- Continued to receive materials and equipment.
- Completed fabrication of contingency bypass skids and shipped to site.

- Completed inlet and outlet tie-ins for contingency skids.
- Continued to fabricate piping segments for project upgrades.

Westampton

- Completed project estimate updates and URB approvals from Study (50% CL) to Conceptual (70% CL) to Definitive (90% CL) level estimates.
- Awarded contracts for engineering and procurement services (AEs) to NV-5 Engineering.
- Prepared all required permit packages, submitted applications, and obtained all required permits.
- awarded contracts and received delivery of major materials and equipment – (buildings, piping, Skids, other materials).
- Finalized Interconnection Agreements with Transco.
- Awarded construction contract to Henkels & McCoy.
- Abated and demolished buildings and yard piping.
- Constructed/installed and fitted out equipment building, control building, and equipment platforms.
- Installed all piping and instrumentation.
- Commissioned system.
- Demobilized from the site.
- Completed final site restoration.
- Completed punch list items.
- Completed as-built drawings.

Metric 2 – Estimated Program and Subprogram Completion Dates

The estimated ES II project completion date, and estimated completion dates for each ESII sub-program and the Program as a whole.

Note - Project completion date is defined by the date project closeout report is completed.

Energy Strong II Program

Program	Actual/Forecast In-Service (Last major equipment)	Timeline for Completion
Electric Energy Strong II Program	Mar-24	Mar-25
Gas Energy Strong II Program	Nov-24	May-25

Energy Strong II Accelerated Recovery Programs

Program	Subprogram	Actual/Forecast In-Service	Timeline for Completion
Electric Energy Strong II Program	Electric Flood Mitigation	Mar-24	Nov-24
	Contingency Reconfiguration	Sep-23A	Jun-24
	Grid Modernization - Communication	Dec-23A	Jun-24
	Grid Modernization - ADMS	Mar-24	Jun-24
Gas Energy Strong II Program	M&R Stations Upgrade	Nov-24	May-25

Electric Station Flood Mitigation

Project	Actual/Forecast In-Service	Timeline for Completion[1]	Updates	Expected Changes
Market Street Substation Elimination	Jun-21A	Dec-21A		
Meadow Road Substation	May-23A	Nov-23A		
Academy Street Substation	Oct-21A	Jun-22A		
Ridgefield 4kv Substation Elimination	May-21A	Dec-21A		
Ridgefield 13kv Substation	Dec-22A	Jun-23A		
Hasbrouck Substation	Nov-22A	Jul-23A		
Kingsland Substation	Jul-23A	Jun-24		
Lakeside Avenue Substation	Dec-23A	Oct-24		
Leonia Substation	Nov-22A	May-23A		
Clay Street Substation	Apr-23A	Apr-24		
State Street Substation	Dec-22A	Feb-24		
Toney's Brook Substation	May-23A	Apr-24		
Waverly Substation*	Dec-23A	Mar-25		
Woodlynne Substation	Dec-23A	Jul-24		
Orange Valley Substation	Dec-23A	Dec-24		
Front Street Substation	Dec-23A	Jul-24		

*** Based on updated schedule resulting from Waverly Site Plan application denial by City of Newark**

[1] Project completion date is defined by the date project closeout report is completed.

Contingency Reconfiguration

Project	Actual/Forecast In-Service	Timeline for Completion[1]	Updates	Expected Changes
Reclosers	Jan-22A	Jul-22A		
Fuse Savers	Jan-24	Jun-24		

Grid Modernization - Communication

Project	Actual/Forecast In-Service	Timeline for Completion[1]	Updates	Expected Changes
Wireless Network	Dec-21A	Dec-21A		
Fiber	Feb-24	Aug-24		
Retrofits Reclosers	Dec-21A	Jun-22A		
Radio Commissioning – Reclosers and Fuse Savers	Jan-24	Jun-24		
RDM Recloser	Dec-23	March-24		

Grid Modernization - ADMS

Project	Actual/Forecast In-Service	Timeline for Completion[1]	Updates	Expected Changes
Platform/SCADA Upgrade	Jan-22A	Jun-22A		
DMS/DERMS	Jan-23A	Jun-23A		
OMS	Mar-24	Jun-24		

[1] Project completion date is defined by the date project closeout report is completed.

Gas Metering & Regulation (M&R)

Project	Actual/Forecast In-Service	Timeline for Completion[1]	Updates	Expected Changes
Camden (M&R)	Dec-22A	Oct-23A		
East Rutherford (M&R)	Dec-22A	Jul-23A		
Westampton (M&R)	Oct-21A	May-22A		

[1] Project completion date is defined by the date project closeout report is completed.

ENERGY STRONG II STIUPLATED BASE PROGRAM

Program	Actual/Forecast In-Service (Last major equipment)	Timeline for Completion
Electric Stipulated Base	Mar-24	Jul-24
Gas Stipulated Base	Nov-24	May-25

Electric Stipulated Base

Project	Actual/Forecast In-Service	Timeline for Completion[1]	Updates	Expected Changes
Paramus Substation	Nov-22A	May-24		
Hamilton Substation	Oct-22A	May-23A		
Woodbury Substation	Mar-24	Sep-24		
Plainfield	Dec-22A	Jun-23A		
State Street Outside Plant	Dec-22A	Jul-24		
Outside Plant – Higher design Standard (OP-HDS)	Dec-23A	Jun-24		

[1] Project completion date is defined by the date project closeout report is completed.

Gas Metering & Regulation (M&R) Stipulated Base

Project	Actual/Forecast In-Service	Timeline for Completion[1]	Updates	Expected Changes
Mt. Laurel (M&R)	Dec-23A	May-24		
Central (M&R)	Sep-23A	May-24		
Paramus (M&R)	Nov-24	May-25		

[1] Project completion date is defined by the date project closeout report is completed.

Metric 3 – SAIFI/MAIFI

A. This metric includes data for circuits involved in the Major and Non-Major events in **Q4-2023.**

- There were No Major Events in Q4-2023, therefore only the Non-major Event Report is included for this period.

Detailed tables for this metric (Non-major Events) are included at the end of this report.

Metric 3 Reports Included for Q4-2023

- Table M3.1 – Quarterly Report Non-Major Event Performance. (Clause #47)

Metric 4 – Quarterly and Program To-Date Forecast and Actual Costs

Flood Mitigation

Quarter Performance (Q4-2023, October to December)

Cost Type	Actuals	Forecast*	Variance ($)	Variance (%)
Material	$4,831,274	$3,569,495	$1,261,779	35%
Other Costs	$21,190,126	$26,798,147	($5,608,021)	-21%
Total	$26,021,400	$30,367,642	($4,346,242)	-14%

Program to Date (Q4-2023, October to December)

Cost Type	Actuals	Forecast	Variance ($)	Variance (%)
Material	$103,243,706	$131,266,263	($28,022,558)	-21%
Other Costs	$232,194,732	$208,518,416	$23,676,316	11%
Total	$335,438,437	$339,784,679	($4,346,241)	-1%

Contingency Reconfiguration

Quarter Performance (Q4-2023, October to December)

Cost Type	Actuals	Forecast*	Variance ($)	Variance (%)
Material	$157,323	$221,256	($63,933)	-29%
Other Costs	$465,636	$167,987	$297,649	177%
Total	$622,959	$389,243	$233,716	60%

Program to Date (Q4-2023, October to December)

Cost Type	Actuals	Forecast	Variance ($)	Variance (%)
Material	$58,927,925	$52,426,177	$6,501,748	12%
Other Costs	$86,821,659	$93,089,691	($6,268,032)	-7%
Total	$145,749,584	$145,515,868	$233,716	0%

Grid Modernization - Communication

Quarter Performance (Q4-2023, October to December)

Cost Type	Actuals	Forecast*	Variance ($)	Variance (%)
Material	($388,732)	($712,060)	$323,328	-45%
Other Costs	$1,047,838	$1,061,900	($14,062)	-1%
Total	$659,105	$349,840	$309,266	88%

Program to Date (Q4-2023, October to December)

Cost Type	Actuals	Forecast	Variance ($)	Variance (%)
Material	$2,467,700	$13,011,072	($10,543,372)	-81%
Other Costs	$62,531,136	$51,844,237	$10,686,900	21%
Total	$64,998,836	$64,855,308	$143,527	0%

Grid Modernization – ADMS

Quarter Performance (Q4-2023, October to December)

Cost Type	Actuals	Forecast*	Variance ($)	Variance (%)
Material	$0	$564,542	($564,542)	-100%
Other Costs	$4,098,499	$4,795,773	($697,274)	-15%
Total	$4,098,499	$5,360,315	($1,261,816)	-24%

Program to Date (Q4-2023, October to December)

Cost Type	Actuals	Forecast	Variance ($)	Variance (%)
Material	$4,239,317	$11,710,128	($7,470,811)	-64%
Other Costs	$59,729,956	$53,520,961	$6,208,995	12%
Total	$63,969,273	$65,231,089	($1,261,816)	-2%

Electric Stipulated Base

Quarter Performance (Q4-2023, October to December)

Cost Type	Actuals	Forecast*	Variance ($)	Variance (%)
Material	$1,134,704	$122,024	$1,012,680	830%
Other Costs	$11,770,872	$13,854,277	($2,083,405)	-15%
Total	$12,905,576	$13,976,301	($1,070,725)	-8%

Program to Date (Q4-2023, October to December)

Cost Type	Actuals	Forecast	Variance ($)	Variance (%)
Material	$29,610,334	$33,762,446	($4,152,112)	-12%
Other Costs	$77,839,892	$74,758,505	$3,081,387	4%
Total	$107,450,226	$108,520,951	($1,070,725)	-1%

Gas M&R

ES II Gas M&R Program Q4-2023 Performance

Quarter Performance (Q4-2023, October to December)

Cost Type	Actuals	Forecast*	Variance ($)	Variance (%)
Material	$269,307	$1,472,163	($1,202,856)	-82%
Other Costs	$7,908,411	$14,956,172	($7,047,761)	-47%
Total	$8,177,718	$16,428,336	($8,250,618)	-50%

Program to Date (Q4-2023, October to December)

Cost Type	Actuals	Forecast	Variance ($)	Variance (%)
Material	$26,109,909	$40,924,586	($14,814,678)	-36%
Other Costs	$93,891,729	$87,327,669	$6,564,060	8%
Total	$120,001,638	$128,252,255	($8,250,618)	-6%

* Quarterly forecast is as of October 1, 2023

Similar Projects Comparable to ES II Subprograms

Actual capital expenditures made in the normal course of business on similar projects, identified by comparable ESII sub-program:

ES II Investment Category	Description	Applicable ES II Subprograms	Capital Spend on Comparable Non-ES II Programs
Hardening & Resilience	Harden infrastructure, thereby making it less susceptible to damage from wind, flying debris, and water damage in anticipation of future Major Storm Events; Strengthen the resiliency of the Company's delivery system	* Electric Stations Flood Mitigation * OP-HDS * Gas M&R Flood Mitigation * Electric Contingency Reconfiguration * Electric Grid Modernization	$ 47,090,628
Life Cycle	Reliability - LC replacements	* Electric Stations LC (4kV) Replacement * Gas M&R	$ 94,212,896
Total	**Capital Spend from September 2019 to December 2023**		**$ 141,303,524**

Detailed Tables for Metric 3 for Q3-2023 – SAIFI/MAIFI

Table M3.1 - Quarterly Report Non-Major Event Performance during the quarter. (#47)

This report includes quarterly non-major event performance combining all events

Blank cell indicates no outage for the circuit.
Note: The 0.00000 signifies there was an outage but the value is beyond 5 decimal place

	5 Year Benchmark				Report Quarter Performance (Q1-2023)

Re: NEXT PHASE OF THE PSE&G GAS SYSTEM MODERNIZATION PROGRAM MONTHLY REPORT – FEBRUARY 2023

Dear Acting Secretary Diaz:

Enclosed for filing is the letter and enclosures providing Public Service Electric & Gas Company's (PSE&G's) monthly report for February 2023 on its Next Phase of the Gas System Modernization Program (GSMP II or the Program).

The GSMP II was approved by a Board Order dated May 22, 2018 in BPU Docket No. GR17070776. That Order adopted a Stipulation pursuant to which PSE&G is operating the Program. This report is filed pursuant to paragraph 43 of that Stipulation and is designed to address the first four items contained in Attachment C to that Stipulation.

The first three items are addressed in the attached materials. With regard to item 4, there were no funds or credits received from the United States government, the State of New Jersey, a county or a municipality, for work related to any of the Program projects.

Consistent with the Order issued by the Board in connection with In the Matter of the New Jersey Board of Public Utilities' Response to the COVID-19 Pandemic for a Temporary Waiver of Requirements for Certain Non-Essential Obligations, BPU Docket No. EO20030254, Order dated March 19, 2020, this document is being filed electronically with the Secretary of the Board and the Division of Rate Counsel. No paper copies will follow.

Very truly yours,

Danielle Lopez

Re: NEXT PHASE OF THE PSE&G GAS SYSTEM MODERNIZATION PROGRAM ("GSMP II EXTENSION") MONTHLY REPORT – JANUARY 2024

Dear Secretary Golden:

Attached hereto is Public Service Electric and Gas Company's ("PSE&G") monthly report for January 2024 on its Next Phase of the Gas System Modernization Program ("GSMP II").

GSMP II was approved by the New Jersey Board of Public Utilities (the "Board") by Order dated May 22, 2018 in BPU Docket No. GR17070776. That Order adopted a Stipulation pursuant to which PSE&G executed GSMP II. Subsequently on October 11, 2023, the Board issued an Order adopting a Stipulation to extend GSMP II under the terms and conditions described in the Stipulation ("GSMP II Extension" or the "Program"). This report is being filed pursuant to paragraph 41 of this Stipulation and is designed to address the first four items contained in its Attachment C.

The first three items are addressed in the attached materials. With regard to item 4, there were no funds or credits received from the United States government, the State of New Jersey, a county or a municipality, for work related to any of the Program projects.

Consistent with the Order issued by the Board in connection with In the Matter of the New Jersey Board of Public Utilities' Response to the COVID-19 Pandemic for a Temporary Waiver of Requirements for Certain Non-Essential Obligations, BPU Docket No. EO20030254, Order dated March 19, 2020, this document is being filed electronically with the Secretary of the Board and the Division of Rate Counsel. No paper copies will follow.

Very truly yours,

Danielle Lopez

Re: Infrastructure Advancement Program – Semi Annual Report January 2023 to June 2023

Dear Secretary Golden:

Enclosed for filing is Public Service Electric and Gas Company's semi-annual Infrastructure Advancement Program report for the period January 2023 to June 2023.

The Infrastructure Advancement Program ("IAP") was addressed by a Board Order dated June 29, 2022 (June 29th Order) in Docket Nos. EO2111211 and GO21112121. That Order adopted a Stipulation pursuant to which PSE&G is operating the program known as IAP.

Paragraph 26 of that Stipulation requires reports on:

- The estimated total quantity of work and the quantity completed to date or, if the project work cannot be quantified with numbers, the major tasks completed, e.g., design phase, material procurement, permit gathering, phases of construction;
- The forecasted and actual IAP costs-to-date for the reporting period and for the Program-to-date; where project work is identified by major category (with the actual variances from forecasted amounts expressed in dollar and percentage terms);
- The estimated IAP Project completion date, and estimated completion dates for each IAP subprogram and the Program as a whole;
- Anticipated changes to IAP Projects, if any;
- Actual capital expenditures made by the utility in the normal course of business on similar project work, identified by major category; and
- Any other performance metric concerning the IAP required by the Board.
- For circuits improved within the Spacer Cable Conversion Project, Lashed Cable Replacement Project, and Spacer Upgrade Project, PSE&G will provide System Average Interruption Duration Index ("SAIDI") results for Major Event11 performance at the circuit level (redacted and confidential unredacted) for circuits affected by a Major Event during the reporting period and at the operating area level and system wide. The SAIDI results will be reported and measured against a baseline that reflects performance for each circuit

under Major Event conditions for the prior five (5) years from the Program start date. The report will include the SAIDI results at the circuit level for the reporting period.

- For circuits improved upon within the Spacer Cable Conversion Project, Lashed Cable Replacement Project, Spacer Upgrade Project, and Conventional Underground Cable Replacement Project, PSE&G will include non-Major Event performance (where a non-Major Event excludes all "Major Events" as defined at N.J.A.C. 14:5-1.2) including circuit designation (information to be provided redacted and confidential unredacted), that reflects non-Major Event conditions for the reporting period. In addition to SAIDI, the Company will report non-Major Event data for Customer Average Interruption Duration Index ("CAIDI") and System Average Interruption Frequency Index ("SAIFI"). The SAIDI results will be reported and measured against a baseline that reflects performance for each circuit under non-Major Event conditions for the prior five (5) years from the Program start date.

The reporting requirements listed in paragraph 26 of the Stipulation are addressed by the enclosed materials.

Please contact the undersigned with any questions or concerns.

Very truly yours,

Danielle Lopez

INFRASTRUCTURE ADVANCEMENT PROGRAM

SEMI-ANNUAL REPORT

TO THE

BOARD OF PUBLIC UTILITIES

Reporting period: January 2023 to June 2023

Table of Contents

Metric 1 – Estimated Quantity of Work

For each Infrastructure Advancement Subprogram:

A. Estimated quantity of work

i. **For the Entire Subprogram**

ii. **Planned to date (based on forecasted estimates at the beginning of the reporting period)**

B. Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. design phase, material procurement, permit gathering, phases of construction;

NOTE: This quarterly report covers Program to date performance up to the 1st half of 2023 period - January 1, 2023 through June 30, 2023. At the end of the period, all subprograms/projects have advanced through varying stages of planning authorization and execution and completion. Where applicable, forecasted and actual units of work and/or major tasks completed are provided.

ELECTRIC PROGRAM

ELECTRIC INSIDE PLANT

Electric Life Cycle Stations

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the modernization of 4kV switchgear at five (5) electric distribution 69/4kV substations, including replacing and upgrading breakers, disconnects, reactors, regulators, relays, and other infrastructure. The following five (5) substations are included within the project:

- Fortieth Street
- McLean Blvd
- Teaneck
- Tonnelle Ave
- Totowa

ii. **Planned to Date:** Major work planned to the end of June 2023:

Fortieth:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings issued
- Detailed Engineering Start
- L&P package issued

McLean:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings issued

Teaneck:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued

Tonnelle:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings issued
- L&P package issued

Totowa:

- Major Equipment POs issued
- KDR package approved
- L&P package issued
- SCD permit issued
- Preliminary Vendor Drawings Issued

B. Quantity of Work Completed to Date:

Fortieth:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued
- Detailed Engineering Start
- L&P package issued

McLean:

- A&E contract and PO issued for detailed engineering
- Major Equipment POs issued
- KDR package approval
- Preliminary Vendor Drawings Issued

Teaneck:

- A&E contract and PO issued for detailed engineering
- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued

Tonnelle:

- A&E contract and PO issued for detailed engineering
- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued

Totowa:

- Major Equipment POs issued
- KDR package approval
- L&P package issued
- SCD permit issued
- Preliminary Vendor Drawings Issued

Electric Stations 26kV Oil Circuit Breakers (OCB) Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 36 Oil Circuit Breakers.

ii. **Planned to Date:** Major work planned to the end of June 2023:

Replacement of six 26kV Oil Circuit Breakers.

B. Quantity of Work Completed to Date:

Replaced four 26kV Oil Circuit Breakers.

ELECTRIC OUTSIDE PLANT

Electric Lashed Cable Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes replacing approximately 8 miles of existing lashed primary cable construction with spacer cable construction that is designed to a higher and more resilient standard.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Replacement of 1 mile of lashed primary cable with spacer cable.

B. Quantity of Work Completed to Date:

- January 2023 to June 2023 – Replaced 0.79 circuit miles.
- Program to date - Replaced 1.09 circuit miles.

Electric Open Wire to Spacer

A. Estimated Quantity of Work:

i. **Project:** This project will replace aging, 3-phase, open wire construction (cross arm and armless) with PSE&G's current standard, spacer cable type construction. Additionally, replacement work will also require the upgrading of auxiliary equipment as part of the conversion.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- No work currently planned. This program does not begin until 2024.

B. Quantity of Work Completed to Date:

- January 2023 to June 2023 – Replaced 10.21 circuit miles.
- Program to date - Replaced 10.21 circuit miles.

Electric Spacer Hardware Upgrades

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes 160 miles of existing spacer type construction. This project will replace aging spacer units along existing construction with new hardware that is designed to a higher and more resilient standard. Also, worn, defective, or metallic tangent brackets will be replaced with a newer fiberglass tangent bracket. Messenger ground wire will be installed at every pole if not currently installed.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Completion of 40 circuit miles.

B. Quantity of Work Completed to Date:

- January 2023 to June 2023 – Completed 57 circuit miles.
- Program to Date – Completed 79 circuit miles.

Electric Conventional Underground (CUG) Cable Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 34 miles of conventional underground cable.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Civil work to repair crushed conduit.
- Complete all CUG's in Palisades & Central.

B. Quantity of Work Completed to Date:

- January to June 2023 – Replaced 1.81 circuit miles of cable.
- Program to date – Replaced 6.58 circuit miles of cable.

Electric Buried Underground Distribution (BUD) Cable Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 110 miles of BUD cable.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- No Major Activities Planned.

B. Quantity of Work Completed to Date:

- January to June 2023 – Replaced 0.11 circuit miles of cable.
- Program to date – Replaced 0.11 circuit miles of cable.

Electric Capacitor Bank Upgrades

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 479 capacitors. The following stations have been identified for this project:

- Palisades Div. – Penhorn (76)
- Metropolitan Div. – West Caldwell (169)
- Central Div. – Pierson (95)
- Southern Div. – Levittown (139)

ii. **Planned to Date:** Major work planned to the end of June 2023:

- PO for 80 units to be issued by early May 2023.

B. **Quantity of Work Completed to Date:** Major Activities completed by end of June 2023:

- PO issued in April for delivery of 80 units in 2023.
- Completed station/circuit testing for 604 existing capacitors.

Electric Open Wire Secondary Upgrades

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of approximately 50 miles over 139 circuits of Open Wire Secondary across the entire PSEG service territory with new secondary cable that have higher capacity and are more resistant to storms and tree contacts. In addition, in areas with lower rated 25kVa transformers in place, new larger 50kVa capacity transformer will be installed.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Planned to complete 16.8 miles through June out of total estimate of 37 miles for the year 2023.

B. Quantity of Work Completed to Date:

2023 construction completion metrics by division:

- Palisades –
  - 24 circuits worked
  - 60,682 feet of wire replaced
- Metropolitan –
  - 47 circuits worked
  - 45,610 feet of wire replaced
- Central –
  - 16 circuits worked
  - 29,819 feet of wire replaced
- Southern –
  - 18 circuits worked
  - 51,123 feet of wire replaced

GAS METERING & REGULATION (M&R) STATIONS

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes implementation of life cycle upgrades 4 Gas M&R Stations (Brooklawn, Hamilton, Hanover, and Hillsborough) listed in the Program Stipulation and life cycle upgrades at all 4 M&R Stations as part of the IAP Gas Subprogram.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Award Detailed Design Engineering to A/E firms for all 4 Stations.
- Start Detailed Design Engineering for all 4 Stations.
- Award material procurement PO to A/E firms (Brooklawn & Hillsborough)
- Finalize Piping & Instrumentation Diagram (P&ID) drawings packages (Brooklawn & Hillsborough)
- Start Site Plan drawings packages (Brooklawn & Hillsborough)

B. Quantity of Work Completed to Date:

- Started Detailed Design Engineering for all 4 stations.
- Completed P&ID drawings packages (Brooklawn & Hillsborough)
- Started KDR drawings package review (Brooklawn & Hillsborough)
- Started Interconnect Agreement with gas pipeline operators (Brooklawn & Hillsborough)
- Completed Site Plan drawings package (Brooklawn)
- Started Site Plan drawings package (Hillsborough)

Metric 2 – Estimated Program and Subprogram Completion Dates

The estimated IAP project completion date, and estimated completion dates for each IAP sub-program and the Program as a whole.

PROGRAM

Program	Subprogram	Forecast In-Service	Timeline for Completion*
IAP	Electric & Gas	Jun-26	Dec-26

SUBPROGRAMS

Program	Subprogram	Forecast In-Service	Timeline for Completion*
Electric	Life Cycle Projects	Sep-25	Mar-26
Electric	26kV Oil Circuit Breaker Replacement	Jun-26	Dec-26
Electric	Lashed Cable	May-26	Nov-26
Electric	Open Wire to Spacer	Dec-25	Jun-26
Electric	Spacer Hardware	Dec-23	Jun-24
Electric	CUG Cable	Jun-26	Dec-26
Electric	Capacitor Bank Upgrades	Jun-26	Dec-26
Electric	Open Wire Secondary Upgrades	Dec-23	Jun-24
Electric	BUD Cable	Jun-26	Dec-26
Gas	M&R Stations	Oct-25	Jul-26

*** Timeline for Completion is defined by the completion date of project closeout report.**

ELECTRIC INSIDE PLANT

Electric Life Cycle Stations

Project	Forecast In-Service	Timeline for Completion	Updates	Expected Changes
Tonnelle Ave Substation	Jan-25	Jul-25

Hanover M&R	Oct-25	Jul-26		

Metric 3 – Circuit Performance - SAIDI/SAIFI/CAIDI

This metric includes data for completed circuits involved in the Major and Non-Major events occurred in the 1st half of 2023, from January 1st, 2023 to June 30th, 2023.

A. Reports included for **Major events** in 1st half of 2023 –

No Major Events occurred in the reporting period.

B. Reports included for **Non-Major Events** in 1st half of 2023 –

M3.B.a Conventional Underground Cable Replacement.
M3.B.b Spacer Hardware Upgrades.
M3.B.c Lashed Cable Replacement.
M3.B.d Open Wire to Spacer.

Detailed tables for this metric are included at the end of this report, page 24 and onwards.

Metric 4 – Semi Annual and Program To-Date Forecast and Actual Costs with Variance

ELECTRIC INSIDE PLANT

Electric Life Cycle Stations

- Accelerated Recovery

VIA ELECTRONIC MAIL ONLY
Sherri Golden, Board Secretary
Board of Public Utilities
44 South Clinton Avenue, 1st Floor
P.O. Box 350
Trenton, New Jersey 08625-0350

Re: Infrastructure Advancement Program – Semi Annual Report July 2023 to December 2023

Dear Secretary Golden:

Enclosed for filing is Public Service Electric and Gas Company's semi-annual Infrastructure Advancement Program report for the period July 2023 to December 2023.

The Infrastructure Advancement Program ("IAP") was addressed by a Board Order dated June 29, 2022 (June 29th Order) in Docket Nos. EO2111211 and GO21112121. That Order adopted a Stipulation pursuant to which PSE&G is operating the program known as IAP.

Paragraph 26 of that Stipulation requires reports on:

- The estimated total quantity of work and the quantity completed to date or, if the project work cannot be quantified with numbers, the major tasks completed, e.g., design phase, material procurement, permit gathering, phases of construction;
- The forecasted and actual IAP costs-to-date for the reporting period and for the Program-to-date; where project work is identified by major category (with the actual variances from forecasted amounts expressed in dollar and percentage terms);
- The estimated IAP Project completion date, and estimated completion dates for each IAP subprogram and the Program as a whole;
- Anticipated changes to IAP Projects, if any;
- Actual capital expenditures made by the utility in the normal course of business on similar project work, identified by major category; and
- Any other performance metric concerning the IAP required by the Board.
- For circuits improved within the Spacer Cable Conversion Project, Lashed Cable Replacement Project, and Spacer Upgrade Project, PSE&G will provide System Average Interruption Duration Index ("SAIDI") results for Major Event11 performance at the circuit level (redacted and confidential unredacted) for circuits affected by a Major Event during the reporting period and at the operating area level and system wide. The SAIDI results will be reported and measured against a baseline that reflects performance for each circuit

under Major Event conditions for the prior five (5) years from the Program start date. The report will include the SAIDI results at the circuit level for the reporting period.

- For circuits improved upon within the Spacer Cable Conversion Project, Lashed Cable Replacement Project, Spacer Upgrade Project, and Conventional Underground Cable Replacement Project, PSE&G will include non-Major Event performance (where a non-Major Event excludes all "Major Events" as defined at N.J.A.C. 14:5-1.2) including circuit designation (information to be provided redacted and confidential unredacted), that reflects non-Major Event conditions for the reporting period. In addition to SAIDI, the Company will report non-Major Event data for Customer Average Interruption Duration Index ("CAIDI") and System Average Interruption Frequency Index ("SAIFI"). The SAIDI results will be reported and measured against a baseline that reflects performance for each circuit under non-Major Event conditions for the prior five (5) years from the Program start date.

The reporting requirements listed in paragraph 26 of the Stipulation are addressed by the enclosed materials.

Please contact the undersigned with any questions or concerns.

Very truly yours,

Danielle Lopez

INFRASTRUCTURE ADVANCEMENT PROGRAM

SEMI-ANNUAL REPORT

TO THE BOARD OF PUBLIC UTILITIES

Reporting period: July 2023 to December 2023

Table of Contents

Metric 1 – Estimated Quantity of Work

For each Infrastructure Advancement Subprogram:

A. Estimated quantity of work

i. **For the Entire Subprogram**

ii. **Planned to date (based on forecasted estimates at the beginning of the reporting period)**

B. Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. design phase, material procurement, permit gathering, phases of construction;

NOTE: This quarterly report covers Program to date performance up to the 2nd half of 2023 period, July 1, 2023 through December 31, 2023. At the end of the period, all subprograms/projects have advanced through varying stages of planning authorization and execution and completion. Where applicable, forecasted and actual units of work and/or major tasks completed are provided.

ELECTRIC PROGRAM

ELECTRIC INSIDE PLANT

Electric Life Cycle Stations

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the modernization of 4kV switchgear at five (5) electric distribution 69/4kV substations, including replacing and upgrading breakers, disconnects, reactors, regulators, relays, and other infrastructure. The following five (5) substations are included within the project:

- Fortieth Street
- McLean Blvd
- Teaneck
- Tonnelle Ave
- Totowa

ii. **Planned to Date:** Major work planned to the end of December 2023:

Fortieth:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings issued
- Detailed Engineering Start
- L&P package issued

McLean:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings issued

Teaneck:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued

Tonnelle:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings issued
- L&P package issued

Totowa:

- Major Equipment POs issued
- KDR package approved
- L&P package issued
- SCD permit issued
- Preliminary Vendor Drawings Issued

B. Quantity of Work Completed to Date:

Fortieth:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued
- Detailed Engineering Start
- L&P package issued

McLean:

- A&E contract and PO issued for detailed engineering
- Major Equipment POs issued
- KDR package approval
- Preliminary Vendor Drawings Issued

Teaneck:

- A&E contract and PO issued for detailed engineering
- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued

Tonnelle:

- A&E contract and PO issued for detailed engineering
- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued

Totowa:

- Major Equipment POs issued
- KDR package approval
- L&P package issued
- SCD permit issued
- Preliminary Vendor Drawings Issued
- Civil Construction Started

Electric Stations 26kV Oil Circuit Breakers (OCB) Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 36 Oil Circuit Breakers.

ii. **Planned to Date:** Major work planned to the end of December 2023:

Replacement of ten 26kV Oil Circuit Breakers.

B. Quantity of Work Completed to Date:

Replaced Three 26kV Oil Circuit Breakers from July 2023 to December 2023

Replaced Seven 26kV Oil Circuit Breakers from program to date.

ELECTRIC OUTSIDE PLANT

Electric Lashed Cable Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes replacing approximately 8 miles of existing lashed primary cable construction with spacer cable construction that is designed to a higher and more resilient standard.

ii. **Planned to Date:** Major work planned to the end of December 2023:

- Replacement of 1 mile of lashed primary cable with spacer cable.

B. Quantity of Work Completed to Date:

- July 2023 to December 2023 – Replaced 0.6 circuit miles.
- Program to Date - Replaced 1.7 circuit miles.

Electric Open Wire to Spacer

A. Estimated Quantity of Work:

i. **Project:** This project will replace aging, 3-phase, open wire construction (cross arm and armless) with PSE&G's current standard, spacer cable type construction. Additionally, replacement work will also require the upgrading of auxiliary equipment as part of the conversion.

ii. **Planned to Date:** Major work planned to the end of December 2023:

- Work on Open Wire to Spacer was originally planned to start in 2024. However, work started ahead of schedule in 2023.

B. Quantity of Work Completed to Date:

- July 2023 to December 2023 – Replaced 6.9 circuit miles.
- Program to Date - Replaced 17.1 circuit miles.

Electric Spacer Hardware Upgrades

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes 160 miles of existing spacer type construction. This project will replace aging spacer units along existing construction with new hardware that is designed to a higher and more resilient standard. Also, worn, defective, or metallic tangent brackets will be replaced with a newer fiberglass tangent bracket. Messenger ground wire will be installed at every pole if not currently installed.

ii. **Planned to Date:** Major work planned to the end of December 2023:

- Completion of 61.5 circuit miles.

B. Quantity of Work Completed to Date:

- July 2023 to December 2023 – Completed 79.5 circuit miles.
- Program to Date – Completed 158.5 circuit miles.

Electric Conventional Underground (CUG) Cable Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 34 miles of conventional underground cable.

ii. **Planned to Date:** Major work planned to the end of December 2023:

- Civil work to replace existing crushed conduit.
- Complete all CUG's in Palisades & Central.

B. Quantity of Work Completed to Date:

- July 2023 to December 2023 – Replaced 1.1 circuit miles of cable.
- Program to Date – Replaced 3.2 circuit miles of cable.

Electric Buried Underground Distribution (BUD) Cable Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 110 miles of BUD cable.

ii. **Planned to Date:** Major work planned to the end of December 2023:

- HDD in Southern & Central Division
- Build MHC systems in Palisades and Metro Division
- Final test new cable with IMCORP

B. Quantity of Work Completed to Date:

- July 2023 to December 2023 – Replaced 3.6 circuit miles of cable.
- Program to Date – Replaced 3.7 circuit miles of cable.

Electric Capacitor Bank Upgrades

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 479 capacitors. The following stations have been identified for this project:

- Palisades Div. – Penhorn (76)
- Metropolitan Div. – West Caldwell (169)
- Central Div. – Pierson (95)
- Southern Div. – Levittown (139)

ii. **Planned to Date:** Major work planned to the end of December 2023:

- Complete existing capacitor bank circuit operational validations for targeted replacements.

B. **Quantity of Work Completed to Date:** Major Activities completed by end of December 2023:

- Work with vendor and System Protection group to develop revised circuit modeling for new advanced capacitor banks.
- Performed factory acceptance testing with both internal & external stake holders
- Developed final revision of construction standards for new advanced capacitor banks
- Initial circuit engineering completed in Palisades division for PEH8004 & HOM8025 circuits
- Conducted initial operational bench testing & SCADA programing
- Installation of 7 total advanced capacitor banks.

PSEG

Electric Open Wire Secondary Upgrades

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of approximately 50 miles over 139 circuits of Open Wire Secondary across the entire PSEG service territory with new secondary cable that have higher capacity and are more resistant to storms and tree contacts. In addition, in areas with lower rated 25kVa transformers in place, new larger 50kVa capacity transformers will be installed.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Planned to complete 8.6 miles through December out of total estimate of 33.9 miles for the year 2023.

B. Quantity of Work Completed to Date:

2023 construction completion metrics by division:

Division	July to Dec 2023		Program To Date	
	Circuits	Wire (ft)	Circuits	Wire (ft)
Palisades	8	9,200	31	69,982
Metropolitain	14	9,738	51	49,203
Central	7	5,037	22	34,142
Southern	1	3,000	13	54,123

GAS METERING & REGULATION (M&R) STATIONS

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes implementation of life cycle upgrades 4 Gas M&R Stations (Brooklawn, Hamilton, Hanover, and Hillsborough) listed in the Program Stipulation and life cycle upgrades at all 4 M&R Stations as part of the IAP Gas Subprogram.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Award Detailed Design Engineering to A/E firms for all 4 Stations.
- Start Detailed Design Engineering for all 4 Stations.
- Award material procurement PO to A/E firms (Brooklawn & Hillsborough)
- Finalize Piping & Instrumentation Diagram (P&ID) drawings packages (Brooklawn & Hillsborough)
- Start Site Plan drawings packages (Brooklawn & Hillsborough)

B. Quantity of Work Completed to Date:

- Started Detailed Design Engineering for all 4 stations.
- Completed P&ID drawings packages (Brooklawn & Hillsborough)
- Started KDR drawings package review (Brooklawn & Hillsborough)
- Started Interconnect Agreement with gas pipeline operators (Brooklawn & Hillsborough)
- Completed Site Plan drawings package (Brooklawn)
- Started Site Plan drawings package (Hillsborough)

Metric 2 – Estimated Program and Subprogram Completion Dates

The estimated IAP project completion date, and estimated completion dates for each IAP sub-program and the Program as a whole.

PROGRAM

Program	Subprogram	Forecast In-Service	Timeline for Completion*
IAP	Electric & Gas	Jun-26	Dec-26

SUBPROGRAMS

Program	Subprogram	Forecast In-Service	Timeline for Completion*
Electric	Life Cycle Projects	Oct-25	Dec-26
Electric	26kV Oil Circuit Breaker Replacement	Jun-26	Dec-26
Electric	Lashed Cable	Feb-26	Aug-26
Electric	Open Wire to Spacer	Dec-25	Jun-26
Electric	Spacer Hardware	Mar-24	Sep-24
Electric	CUG Cable	Jun-26	Dec-26
Electric	Capacitor Bank Upgrades	Jun-26	Dec-26
Electric	Open Wire Secondary Upgrades	Jan-24	Jul-24
Electric	BUD Cable	Jun-26	Dec-26
Gas	M&R Stations	Oct-25	Jul-26

*** Timeline for Completion is defined by the completion date of project closeout report.**

ELECTRIC INSIDE PLANT

Electric Life Cycle Stations

Project	Forecast In-Service	Timeline for Completion	Updates	Expected Changes
Tonnelle Ave Substation	Sep-25	Mar-26		
40th Street Substation	Feb-25	Aug-25		
Totowa Substation	Sep-25	Apr-26		
McLean Blvd Substation	Oct-25	Apr-26		
Teaneck Substation	Oct-25	Oct-26		

Electric Stations 26kV OCB Replacement

Project	Forecast In-Service	Timeline for Completion	Updates	Expected Changes
26kV OCB Replacement	Jun-26	Dec-26		

ELECTRIC OUTSIDE PLANT

Electric Lashed Cable Replacement

Project	Forecast In-Service	Timeline for Completion	Updates	Expected Changes
Lashed Cable Replacement	Feb-26	Aug-26		

Electric Open Wire to Spacer

Hamilton M&R	Oct-25	Jul-26		
Hanover M&R	Oct-25	Jul-26		

Metric 3 – Circuit Performance - SAIDI/SAIFI/CAIDI

This metric includes data for completed circuits involved in the Major and Non-Major events occurred in the 2nd half of 2023, from July 1st, 2023, to December 30th, 2023.

A. Reports included for **Major events** in 1st half of 2023 –

No Major Events occurred in the reporting period.

B. Reports included for **Non-Major Events** in 1st half of 2023 –

M3.B.a Conventional Underground Cable Replacement.
M3.B.b Spacer Hardware Upgrades.
M3.B.c Lashed Cable Replacement.
M3.B.d Open Wire to Spacer.

Detailed tables for this metric are included at the end of this report, page 24 and onwards.

Metric 4 – Semi Annual and Program To-Date Forecast and Actual Costs with Variance

ELECTRIC INSIDE PLANT

Electric Life Cycle Stations

- Accelerated Recovery

Semi-Annual Performance (2023-2, July to December) / **Program to Date (December, 2023)**

Cost	Forecast*	Actual	Variance ($)	Variance (%)		Cost	Forecast*	Actual	Variance ($)	Variance (%)

DIRECT TESTIMONY
OF
CLIFFORD PARDO
9+3 UPDATE

VICE-PRESIDENT OF TAX AND ASSISTANT
CONTROLLER

April 15, 2024
P-4 R-1

TABLE OF CONTENTS

Direct Testimony
Of
Clifford Pardo
Vice-President of Tax and Assistant Controller
PSEG Services Corporation

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Clifford Pardo. My business address is 80 Park Plaza, Newark, New Jersey.

Q. By whom are you employed and in what capacity?

A. I am employed by PSEG Services Corporation as Vice-President of Tax and Assistant Controller. My professional credentials are attached as Schedule CP-1.

Q. What is the purpose of your testimony?

A. In this proceeding, I am testifying on behalf of Public Service Electric and Gas Company ("PSE&G," "Public Service," or "the Company"). The purpose of my testimony is to present and support tax expense, accumulated deferred income taxes ("ADIT"), modifications to the existing Tax Adjustment Credit ("TAC"), the consolidated tax ratemaking adjustment, and other tax issues arising in this proceeding. Specifically, my testimony is comprised of the following sections:

- Section I provides an introduction;
- Section II summarizes the impacts of the 2017 Tax Cuts and Jobs Act ("TCJA") and 2022 Inflation Reduction Act ("IRA"), and their impacts on this rate proceeding;
- Section III presents current and deferred tax expense and ADIT included in this test period;
- Section IV discusses modifications to the TAC; and

- Section V provides the consolidated tax ratemaking adjustment and presents a computation of that adjustment.

Q. Do you sponsor any schedules as part of your prepared testimony?

A. Yes. I sponsor the following schedules that were prepared or compiled under my direct supervision:

- Schedule CP-1 describes my professional qualifications and business experience;
- Schedule CP-2 R-1 details the computation of income tax expense for electric and gas for the test year;
- Schedule CP-3 R-1 details the computation of accumulated deferred income taxes for electric and gas for the test year;
- Schedule CP-4 details the computation of the estimated annual net Mixed Service Deduction and the Historic Mixed Service ADIT balance; and
- Confidential Schedule CP-5 R-1 details the computation of the CTA.

II. <u>IMPACT OF TCJA AND IRA</u>

A) TCJA

Q. Does TCJA have implications for this proceeding?

A. Yes. On December 22, 2017, the President signed into law a bill entitled "To provide for reconciliation pursuant to titles II and V of the concurrent resolution on the budget for fiscal year 2018", more commonly known as the "Tax Cuts and Jobs Act" or "TCJA." Below I describe the major provisions of TCJA and discuss their impacts on this proceeding.

Q. Please describe the implications to PSE&G of the reduction in the federal corporate income tax rate.

A. Effective January 1, 2018 the TCJA reduced the federal corporate income tax rate from 35% to 21%. This rate change had a number of implications, including:

- Reducing PSE&G's tax expense after 2017;
- Increasing PSE&G's operating income by lowering tax expense;
- Creating a portion of PSE&G's 2017 ADIT balance in excess of what is needed to offset future tax liabilities (excess deferred income taxes or "EDIT"); and
- Altering the after tax cost of debt as well as the revenue gross-up factor and the interest synchronization computation.

Q. What are deferred income taxes and how do they impact customers?

A. PSE&G, through the ratemaking process, charges customers current and deferred income tax expense. Current tax expense represents the tax expense expected to be paid to the government for that tax year. Deferred tax expense represents a future tax liability that will be paid when related temporary differences between book and taxable income reverse.

Q. Can you provide an example?

A. An example of such a temporary difference is the difference created by accelerated depreciation. In the case of accelerated depreciation, deductible tax depreciation exceeds book depreciation in the early portion of an asset's life, but then in the later portion of that asset's life, book depreciation exceeds tax depreciation. In total, the amount of depreciation is the same; just the timing is different. Deferred taxes spread the tax benefit of depreciation over the book life of the property, so that every dollar of book depreciation charged to customers carries a tax benefit. This deferred tax also reduces rate base so that customers receive the benefit of the cost-free capital.

Q. How did the TCJA create excess deferred income taxes?

A. Deferred taxes are calculated using the tax rate in effect at the time the deduction is claimed. TCJA was enacted in 2017, and reduced that tax rate from 35% to 21% starting in 2018. Because the tax rate has permanently declined to 21%, when those timing differences reverse, the amount of tax owed will be computed at the new lower 21% rate, not 35%. As a result, a portion of PSE&G's December 31, 2017 ADIT balance was in excess of what is needed to offset future tax liabilities and thus must be returned to customers.

Q. Are there requirements on how the EDIT is returned to customers?

A. Yes, depending on the deduction that caused the ADIT balance. These excess deferred taxes fall into two categories: (1) those restricted by the normalization provisions of the TCJA (sometimes referred to as "protected" EDIT); and (2) those that are not (sometimes referred to as "unprotected" EDIT).

Q. How is the protected EDIT returned to customers?

A. The protected excess deferred taxes must be returned to customers using the Average Rate Assumption Method ("ARAM"). The ARAM provision provides for the reversal of EDIT on a vintage and class basis as the related timing differences reverse, using the weighted average tax rate at which deferred taxes were established.

Q. How is the unprotected EDIT returned to customers?

A. By way of contrast to the protected EDIT, the unprotected excess deferred taxes can be returned to customers over any reasonable period. As approved by the Board on October 29, 2018 at the conclusion of the Company's prior rate case, the Company has been refunding unprotected EDIT over an approximately five-year period through December 31, 2023[1], with a slight remaining balance to be refunded in 2024, in accordance with the IRS Private Letter Ruling ("PLR") discussed below.

Q. How does TCJA address accelerated and "bonus" depreciation?

A. While TCJA provides for 100% depreciation for capital expenditures beginning September 27, 2017, regulated utilities are not eligible for this 100% expensing. Beginning in 2018, only regular Modified Accelerated Cost Recovery System ("MACRS") depreciation may be claimed by regulated utilities.

Q. Does TCJA contain any other changes relevant to this case?

A. No.

B) IRA

Q. Does the Inflation Reduction Act of 2022 impact the current rate proceeding?

A. The IRA enacted a new 15% corporate alternative minimum tax ("CAMT") and made material changes to energy tax credit law. Since enactment, the U.S. Treasury has issued various proposed regulations and Notices that provide interim guidance regarding several provisions of the IRA. The foundation of the CAMT is U.S. GAAP income, the computation starts with net book income to which IRS prescribed adjustments are made. This is referred to

[1] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of an Increase in Electric and Gas Rates and for Changes in Tariffs for Electric and Gas Service, B.P.U.N.J. No. 16 Electric and B.P.U.N.J. No. 16 Gas, and for Changes in Depreciation Rates, Pursuant to N.J.S.A. 48:2-18, N.J.S.A 48:2-21 and N.J.S.A. 48:2-21.1, and for Other Appropriate Relief*, BPU Docket Nos. ER18010029 & GR18010030; *I/M/O the New Jersey Board of Public Utilities' Consideration of the Tax Cuts and Jobs Act of 2017*; BPU Docket No. AX18010001; *I/M/O Public Service Electric and Gas Company for Approval of Revised Rates (Effective on an Interim Basis April 1, 2018) to Reflect the Reduction Under the Tax Cuts and Jobs Act of 2017*, BPU Docket No. ER18030231, Decision and Order Adopting Initial Decision and Stipulation (October 29, 2018) (the "2018 Rate Case Order") at 9-11.

as adjusted financial statement income ("AFSI"). Companies whose three-year historical average AFSI exceeds $1 billion is subject to CAMT from that point forward. In any given year a company will pay the IRS the higher of the CAMT or regular tax. The Notices related to the CAMT state that Treasury anticipates issuing additional guidance along with proposed and final regulations. Many aspects of the IRA remain unclear and in need of further guidance; therefore, the impact the IRA will have on PSE&G's financial statements and this proceeding is subject to continued evaluation and the issuance of additional authoritative guidance.

Q. Does the Company believe PSE&G will be subject to the CAMT?

A. Yes, based on the guidance U.S. Treasury has released through Q1, 2024. However, this could change based on the issuance of additional authoritative guidance or interpretation of existing guidance. Based on the understanding as of Q1, 2024 , the Company calculated a CAMT liability for 2023 of $55,294,627 for the electric utility and $50,622,621 for gas distribution, or a total for PSE&G of $105,917,249. For clarity, these amounts represent the amount by which the CAMT liability exceeds the regular tax liability. See the revised response to RCR-A-0087 UPDATE for the calculation of the CAMT for the utility. This calculation was not part of the Company's initial filing but was recorded in PSE&G's audited books and recorded in December 2023.

Q. What is the impact of the CAMT on income tax expense?

A. There is no change to PSE&G's income tax expense and cost of service as a result of the CAMT. The CAMT amounts noted above increase current tax expense but are fully offset by a reduction in deferred taxes with no net change to total income tax expense. However, the reduction in deferred taxes results in a decrease in accumulated deferred income taxes and increase in the Company's rate base.

Q. Is the Company seeking recovery of the CAMT in this proceeding?

A. Due to the uncertainty of the rules, not at this time. The Company is still awaiting additional guidance that could increase, decrease or eliminate the CAMT liability for PSE&G. Rather, the Company is proposing to recover any impact of the CAMT through the TAC, once the final rules are clearer, as described in more detail in the testimony of Company Witness Stephen Swetz. There is no impact from the CAMT in the Company's ADIT balance or income tax expense used to set base rates in this proceeding. Further, while Mr. Swetz has adjusted the TAC schedules to allow for recovery on the working capital impact of any CAMT payments, the Company is not including any amount of the CAMT at this time while it awaits additional guidance on the rules.

III. TAX EXPENSE AND ACCUMULATED DEFERRED INCOME TAXES

Q. Have you determined the appropriate income tax expense component of operating income for the filed test period?

A. Yes. I have computed a total income tax expense for the test period of $25 million for electric and a total income tax benefit of ($29) million for gas. This is comprised of a current tax benefit of ($8) million for electric and a current tax expense of $11 million for gas, and a deferred tax expense of $33 million for electric and a deferred tax benefit of $40 million for gas. The details of this determination are shown on Schedule CP-2 R-1, which shows current tax expense and significant components of deferred tax expense. I provided this tax expense to Mr. McFadden for inclusion in his Schedule MPM–28 R-1. The income tax expense includes a tax benefit for bad debt write offs, which is excluded in a pro forma adjustment in the testimony of Mr. McFadden, and is included in Schedule MPM-53 R-1.

Q. Did you prepare a schedule showing the balance of ADIT associated with utility plant?

A. Yes. It can be found at Schedule CP–3 R-1. In the schedule, I have broken utility-plant-related ADIT down into the following categories:

- ***Accelerated depreciation and other*** – includes the federal deferred taxes that either arise or reverse through depreciation deductions (including bonus depreciation) allowed pursuant to sections 167 and 168 of the Internal Revenue Code ("IRC").
- ***Safe Harbor Adjusted Repair Expense ("SHARE") deductions*** – includes federal deferred taxes associated with projects that are claimed as deductible repair expenses pursuant to IRC section 162 but are capital assets for financial reporting purposes. This deduction is described in more detail below.
- ***Mixed Service tax deduction*** – includes existing federal deferred taxes associated with projects that historically claimed a tax deduction for Mixed Service costs under IRC 162. This deduction is described in more detail below.
- ***NJ corporate business tax*** – includes all deferred taxes provided for the NJ Corporate Business Tax.

Mr. McFadden has reflected these deferred taxes as a rate base reduction in Schedule MPM–03 R-1.

<u>SHARE Deduction</u>

Q. What is a SHARE deduction?

A. The SHARE deduction is an acronym for the repair deductions discussed below.

Q. What are repair deductions?

A. On September 12, 2011, the IRS released Revenue Procedure 2011-43, which was later modified in Revenue Procedure 2014-16, detailing a safe harbor method for determining repair deductions for electric transmission and distribution property. Generally, for book and tax purposes, costs are either capitalized into the depreciable basis of an asset or currently expensed for book purposes and deducted for tax purposes. For tax purposes, costs associated with a unit of property are considered deductible repair expenses and not capitalized unless they are incurred for either a) betterment of the property, b) restoration of the property, or c) to adapt the unit of property to a new or different use as determined under the Revenue Procedure.

Q. How do the repair deduction rules apply?

A. These rules apply to all vintages of property and permit immediate expensing of all costs associated with projects considered a deductible repair expense pursuant to IRC section 162, resulting in a tax reduction in the year incurred, but are capital assets for financial reporting and ratemaking purposes. PSE&G has claimed enhanced repair deductions since 2010 for both its electric and gas distribution operations (referred to as a "SHARE deduction"). SHARE deductions are considered unprotected.

Q. Has the IRS provided additional guidance on the Gas SHARE deductions?

A. Yes. In April 2023, the Treasury released Revenue Procedure 2023-15 associated with determining the repair deduction for gas transmission and distribution property.

The impact, if any, of this Revenue Procedure is in process of being determined and possibly may require additional authoritative guidance. The Company reserves the right to propose an adjustment to the TAC to capture the impact of Revenue Procedure 2023-15 including any further guidance issued.

Q. How is the SHARE deduction returned to customers?

A. The SHARE deduction is returned to customers through the TAC in two ways: 1) amortization of the historic SHARE balance and 2) flow-back of the current net SHARE tax benefit. The historic SHARE was a component of the Company's ADIT in the 2018 base rate case. Per the Stipulation of Settlement approved by the Board in the 2018 Rate Case Order, the balance is being flowed-back to customers over a 10-year period, with one-third of the balance returned in the first five years and the two-thirds remaining balance returned in the remaining five years.[2] The current SHARE is calculated as the on-going, annual SHARE tax deduction less the book depreciation associated with SHARE deductions multiplied by the federal tax rate. It is contemporaneously flowed back to PSE&G's customers.

Q. Is the SHARE deduction the same each year?

A. No. The SHARE deduction has the potential to significantly vary year-to-year based on the actual plant activity and mix of capital projects placed in service each year that qualifies as repair, which causes volatility in the SHARE deduction.

Mixed Service Deduction

Q. What is a Mixed Service deduction?

A. IRC section 263A governs which costs are capitalizable, deductible, or both, referred to in Treasury Regulation Section 1.263A-1(e)(4)(ii)(C) as "Mixed Service costs." That Treasury regulation defines Mixed Service costs as service costs that are partially allocable to production or resale activities (capitalizable) and partially allocable to nonproduction or non-

[2] 2018 Rate Case Order at 9.

resale activities (deductible). Mixed Service costs are typically thought of as general and administrative costs.

Q. Can you provide an example of a Mixed Service deduction?

A. A company's personnel department may incur costs to recruit employees engaged in the production of self-constructed assets (capitalizable) as well as costs to recruit employees engaged in nonproduction activities (deductible).

Q. How does the Mixed Service deduction impact ADIT?

A. Treasury Regulation section 1.263A applies to all vintages of property and permits immediate deduction of all costs associated with projects pursuant to IRC section 162, resulting in a tax deduction in the year incurred, but are capital assets for financial reporting and ratemaking purposes. ADIT results from the timing difference between financial reporting, which is depreciated over the life of the asset, and tax reporting, which is immediately deducted. Mixed Service deductions are unprotected and not subject to the tax normalization rules.

Q. Is there more than one directive on how to calculate the Mixed Service deduction?

A. Yes. The IRS has issued a number of Industry Director Directives ("IDDs") related to the computation of the Mixed Service deduction. Generally, the regulated utility industry follows IDD No. 5 (LMSB 04-0809-033, 2009), which is based on the simplified service cost method.

Q. Are you proposing a change in the regulatory treatment of the Mixed Service deduction in this proceeding?

A. Yes. As described below, the Company proposes to return both the historic and current Mixed Service deduction to customers through the TAC in the same manner as done for the SHARE.

Q. Do you have any workpapers or schedules supporting your current Mixed Service forecast?

A. Yes. See Schedule CP-4 for the calculation.

Deferred vs Flow-thru Accounting

Q. What is deferred tax accounting and how does it differ from flow-thru accounting?

A. Generally Accepted Accounting Principles ("GAAP"), codified as ASC 740, require comprehensive inter-period tax allocation for all temporary differences between book and tax accounting. Simply stated, a temporary difference is an item of income or expense, for which the difference in basis or timing of recognition in income differs between tax purposes and financial reporting purposes. When a temporary difference is reflected in the computation of taxable income in a different period than it is for financial reporting purposes, there is an impact on the timing of taxation, and GAAP requires that a deferred tax expense or benefit be recorded on the income statement to reflect the future reversal of that temporary difference. A deferred tax expense results in an increase in ADIT liabilities on the balance sheet, and the liability reverses as the Company repays the temporary benefit to the government in the form of higher tax payments in the future. This is what I refer to as deferred tax accounting.

Q. Can you describe flow-through accounting?

A. To state it simply, flow-through accounting puts the utility on a tax return basis (cash basis) for tax recovery in the ratemaking process. Tax expense or benefit of the particular item will flow to customers in the year in which the taxes are reflected in the tax return. Deferred tax accounting, in contrast, matches the tax impact of an item of expense or income with the recovery of that item from customers.

Q. Is either the flow-through or deferred tax accounting method required?

A. Neither method is required in setting rates, subject to two exceptions.

First, for ratemaking purposes, when the tax normalization rules apply, deferred tax accounting is required. Normalization rules apply to deductions associated with accelerated depreciation claimed pursuant to IRC sections 167 and 168. The deduction for accelerated depreciation will be forfeited if the normalization rules are violated by flowing back tax depreciation benefits to customers too quickly. The normalization rules do not apply to deductions claimed under any other section of the Code, such as the SHARE and Mixed Service deductions that are claimed under IRC section 162.

The second exception is that N.J.S.A. 48:2-21.34 requires deferred tax accounting in setting utility rates for all temporary differences used in computing New Jersey ("NJ") State income tax. Therefore, no ADIT computed at the NJ rate may be flowed through, and instead, normalization would be required for the NJ State income tax portion of the SHARE and Mixed Service deductions.

IV. TAX ADJUSTMENT CREDIT

Q. Can you please describe the TAC?

A. The prior base rate proceeding established a separate Electric and Gas TAC ("ETAC" and "GTAC") as set forth on Attachment C of the Stipulation of Settlement approved in the 2018 Rate Case Order. The 2018 Rate Case Order approved the following eight components of the TAC:

- A one-time refund of the excess income tax recovery from January - March 2018 was issued during the two-month period November and December 2018 and included interest based upon the Company's interest rate obtained on its commercial paper and/or bank credit lines utilized in the preceding month;[3]
- Refund of the protected excess deferred tax balance, which is flowed back to customers under the ARAM or any other method as required by the IRS;
- Refund of the unprotected excess deferred tax balance over an approximately five (5) year period through December 31, 2023, with the annual amortization as shown in Attachment C of the Stipulation;
- Refund of the historic SHARE balance as of October 31, 2018 over a 10 year period, with one-third of the balance returned over the first approximately 5 years through December 31, 2023, and the balance returned over the remaining 5 year period ending December 31, 2028;
- Return on the increase in rate base at the Company's after-tax WACC from the flow-through of rate base related excess deferred taxes (comprised of all protected excess

[3] These amounts have been flowed back to customers and has no impact on the current rate proceeding.

deferred taxes, the historic SHARE, and a portion of the unprotected excess deferred taxes as shown in Attachment C of the Stipulation);

- Payment of interest at the Company's after-tax WACC on the balance of the non-rate base related excess deferred taxes until fully refunded over the approximately 5-year period;
- Flow-through of the estimated current period SHARE deduction, plus or minus true-ups from prior periods, calculated as the actual SHARE tax deduction less all associated SHARE book depreciation, multiplied by the Federal tax rate. Any true ups from prior periods will be flowed back to customers in the next appropriate period. Note, this adjustment is inclusive of expenses that made up the ADR repair allowance deduction previously in base rates such that all repair related flow through will be done through the TAC; and
- A revenue gross-up of the net tax flow-through.

The mechanics of the TAC are discussed in the Direct Testimony of Mr. Steven Swetz. Additionally, Attachment C of the Stipulation of Settlement adopted by the Board in the 2018 Rate Case Order set forth the EDIT and SHARE tax benefit balances to be flowed back to customers monthly for the period Jan 2018 through December 2019 and the annual flow back of the protected and unprotected excess deferred taxes for years 2020 through 2029.

Q. Have the balances of the Protected and Unprotected Excess ADIT changed since the 2018 Rate Case Order?

A. Yes. The balances for the Protected and Unprotected Excess ADIT, which were approved to be refunded in the 2018 Rate Case Order, changed for four reasons:

1) A reclassification between the protected and unprotected balance;

2) An ADIT adjustment as a result of the 2017 federal and state return to accruals ("RTA");

3) The result of the IRS ruling on the Company's PLR requests with regard to a change in accounting method and the treatment of cost of removal expenditures, which is discussed in more detail below; and

4) An IRS audit settlement of tax years prior to 2018.

The first two adjustments were included in the Company's 2019 TAC filing and subsequently adjusted to reflect the immaterial impact of the federal benefit of state taxes that resulted from the 2017 state return to accrual.[4] The IRS guidance on the Company's PLR request was not available at the time of the Company's 2019 TAC filing as it was issued in April 2020. The Company incorporated the results of the PLR requests into the final approved TAC rates approved by the Board on July 16, 2020. There has been no change to the Company's historic SHARE balance. The Company has settled its 2011 through 2016 tax return audit with the IRS and reflected any changes to the excess deferred taxes as a result of the settlement in the fourth quarter of 2020. These impacts were included in the 2021 TAC filing.[5]

Q. Do the first two adjustments (reclassification and 2017 RTA) approved in the 2019 TAC filing affect the current filing?

A. Yes. While the adjustments to the balances occurred in 2018, the relative amortization related to these adjustments are being amortized through 2023.

[4] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of Changes in Its Electric Tax Adjustment Credit and Gas Tax Adjustment Credit ("2019 TAC Filing")*, BPU Docket Nos. ER19091302 and GR19091303 (filed September 26, 2019).

[5] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of Changes in its Electric Tax Adjustment Credit and Gas Tax Adjustment Credit ("2021 TAC Filing")*, BPU Docket Nos. ER21101201 & GR21101202 (filed October 29, 2021) at Attachment 1 at 10.

Q. Please explain what are the PLR reclassifications between protected and unprotected deferred income taxes?

A. In compliance with the Company's Base Rate Case Order, PSE&G sought a PLR from the IRS that would give guidance as to whether excess deferred income tax associated with accounting changes to repair deductions and mixed service costs are protected in nature and subject to normalization rules. In addition, PSE&G also required a PLR from the IRS regarding its post-1981 cost or removal and whether amounts were subject to normalization rules and if it is to be treated as a separate temporary difference or part of the overall depreciation temporary difference.

Q. Did PSE&G obtain those private letter rulings?

A. Yes. In April 2020, the IRS issued a ruling to PSE&G that held both the deficient deferred taxes related to COR and the excess deferred taxes associated with accounting method changes related to repair deductions and the capitalization of mixed service costs are unprotected and not subject to the tax normalization rules.

Q. What excess amounts will be amortized pursuant to those PLRs?

A. Pursuant to the guidance in the PLR, PSE&G is flowing back $75 million in total net pre-tax credits to customers. Of that amount, approximately $41 million and $34 million in excess deferred income taxes will be amortized to electric and gas customers, respectfully, through 2024.

Q. Are these amounts currently being amortized back to customers?

A. Yes. On July 16, 2020, the Board approved PSE&G's Updated 2019 TAC filing including the reclassification pursuant to the IRS guidance that these deficient deferred taxes related to COR and the excess deferred taxes are not subject to the tax normalization rules. As such, these amounts have been reclassified and are being amortized through the TAC effective July 16, 2020, as approved by the Board.

Q. What are the benefits associated with the TAC?

A. There are several benefits associated with the TAC:

- Utilizing the TAC allows for an uneven method of amortization, which the Company could not do in a traditional base rate amortization without an annual base rate case.
- It provides a mechanism to stop the amortization of historical ADIT once the repair-related ADIT is fully returned to customers, to avoid possible IRS normalization violations.
    - If the Company were to over-amortize the SHARE-deduction-related ADIT balance, the excess amortization arguably would come from the depreciation-related ADIT, which is protected by the normalization rules. Reversing that deferred tax would result in a normalization violation and the possibility of significant penalties. Use of the TAC eliminates that risk.
- The TAC provides a mechanism that will permit the recovery of IRS audit adjustments, changes, or subsequent clarifications to tax law, or other major tax changes, if any.
    - For example, while the IRS has not challenged the Company's SHARE deductions, tax deductions of this magnitude are routinely scrutinized. Given the size of these deductions and the IRS's policy of auditing multiple years at a time, a final disallowance could be material. Because the tax benefit of any deductions will have already been passed to customers, any IRS disallowance and interest thereon would need to be recovered from customers. The TAC will provide the mechanism to ensure timely recovery.

Q. What is the status of the Excess Deferred Tax balance to be flowed back through the TAC?

A. The reduction in the federal tax rate generated a total of $1 billion of excess deferred taxes. Through the end of 2022, the balance remaining of protected EDIT to be flowed back to customers is approximately $882 million and unprotected EDIT is approximately $203 million. For the test period, the flow back to customers is included in this filing.

Q. Are there any adjustments to the TAC as originally approved in the 2018 rate case?

A. Yes. PSE&G proposes the following adjustments, which are described in more detail later in my testimony:

1) In addition to continuing to flow back the benefit of the historic SHARE deduction, the Company proposes to flow back to customers the net federal tax benefit associated with the historical Mixed Service ADIT balance over approximately five years.

2) The Company proposes to add the current Mixed Service deduction net benefit to the current SHARE deduction net benefit already included in the TAC, but both at a pre-determined, fixed annual amount, with any excess to be flowed back to customers in a subsequent rate case;

3) To better match the seasonal flow of Company pre-tax income, the Company began to amortize the monthly flow back of EDIT and SHARE on a seasonal basis in the 2023 TAC filing to match pre-tax income as described in the 2023 TAC cost recovery

proceeding.[6] In this proceeding, the Company is aligning the return calculation with the seasonal amortization methodology; and

4) The Company proposes to recover/refund the annual impact of the CAMT liability as a result of the IRA through the TAC.

I discuss each proposed change below.

1) Historic Mixed Service

Q. Why are you proposing to flow back the historic Mixed Service deduction through the TAC?

A. The historic Mixed Service deduction is an unprotected deferred tax liability that can be flowed back to customers. This is similar to the current mechanism to flow back the historic SHARE to customers with the exception that it would be over an approximate three-year period instead of 10 years as approved in the last rate case for the historic SHARE. The historic Mixed Service balance is part of ADIT and reducing the Company's rate base. As the tax benefit is flowed back to customers, the ADIT balance declines and the Company's rate base increases. In the same manner as approved for the historic SHARE, the Company can refund this tax benefit to customers on an accelerated basis and earn a return on the increased rate base as a result of the refunds. The TAC allows for the accelerated refund of the Mixed Service net tax benefit while earning its allowed return as its rate base increases. The projected Mixed Service historic ADIT balance as of August 31, 2024 is approximately $366 million, and grossed up to revenues would represent a benefit to customers of $509 million. See Schedule CP-4 for the

---

[6] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of Changes in Its Electric Tax Adjustment Credit and Gas Tax Adjustment Credit ("2023 TAC Filing")*, BPU Docket Nos. ER23090634 and GR23090635 (filed September 1, 2023) (the "2023 TAC Filing").

historic Mixed Service deduction that the Company proposes to be flowed through to customers through the TAC.

2) Annual SHARE and Mixed Service Deduction

Q. Are you proposing to flow back the annual Mixed Service deduction to customers as well?

A. Yes. As described below, the Company proposes that a fixed annual flow back amount be refunded to customers for both the annual SHARE and Mixed Service deductions.

Q. What is the annual Mixed Service and SHARE flow back?

A. The annual SHARE flow back is the annual Federal repair tax deduction less the associated book depreciation multiplied by the federal tax rate. Likewise, the annual Mixed Service flow back is the annual federal Mixed Service tax deduction less the associated book depreciation multiplied by the federal tax rate.

Q. Can you please discuss the proposal to limit the flow-back of the annual net SHARE and Mixed Service deductions?

A. To ensure that PSE&G customers receive the full benefit of these deductions while minimizing fluctuations in Distribution Customers' bills, the Company proposes to flow back a fixed annual benefit of $38 million and $18 million related to the annual SHARE and Mixed Service deduction, respectively, or a combined impact of $56 million. The actual SHARE and Mixed Service deductions will continue to be calculated and tracked annually. To the extent the actual benefit is higher than the proposed flow back amount, the excess would be added to the ADIT balance and flowed back to customers in a subsequent rate case.

Q. What is the benefit of this approach to limit the flow back amounts?

A. A fixed flow back amount will reduce the rate volatility and revenue requirement swings currently occurring in the existing TAC. The Current SHARE fluctuates annually and has seen significant swings, typically recorded in December. In addition, deferring the difference between the actual and proposed flow back amount can increase ADIT and provide an additional unprotected balance to be refunded to customers in a future rate case.

Q. Can you provide a simple example of how the deferral will work?

A. Yes. Assume this proposal is accepted and allows for a net SHARE deduction of $100 be flowed back to customers. However, the actual benefit is $150. The $50 additional benefit would be added to the existing ADIT balance, reduce rate-base, and be flowed back to customers in a subsequent rate case.

3) Monthly Amortization Pattern

Q. Can you please describe why the monthly amortization pattern of EDIT and SHARE flowback has changed and the impact to the return calculation?

A. As described in the Company's 2023 TAC Filing, the Company has changed the monthly amortization pattern to reflect the seasonality of pre-tax income. Historically, approximately 33% of the Company's revenue is generated in the first quarter each year. However, the tax benefits from flowing back the EDIT and SHARE were amortized on a straight-line basis, which caused a monthly mismatch. As a result, in 2023 the Company changed the monthly amortization of the EDIT and SHARE flowback to follow the seasonal pattern as the Company generates pre-tax income. The full-year total to be flowed to customers is not impacted. For the impact to the return calculation, see Schedule SS-ETAC-

1E R-1 for electric and Schedule SS-GTAC-1G R-1 for gas in the Direct Testimony of Mr. Swetz.

4) CAMT

Q. Why do you propose to recover the CAMT through the TAC?

A. There still remains uncertainty on the calculation/rules of the CAMT and its impact to PSE&G as the industry awaits additional guidance from the US Treasury. The TAC allows the Company to adjust annually for any impact resulting from additional US Treasury guidance and interpretation of existing guidance. Further, the TAC provides for a return on the increase in rate base as deferred taxes decline. The CAMT will work in the same way where the Company would calculate a return on the change in rate base as a result of the change in deferred taxes in the annual TAC filings.

Revised TAC

Q. Has the TAC been modified to reflect all of the changes you describe above?

A. Yes. Please see Schedule SS-ETAC-1E R-1 and Schedule SS-GTAC-1G R-1 of Mr. Swetz's testimony for the updated TAC reflecting:

1) The continued refund of the protected EDIT under ARAM;
2) The continued refund of the Historic SHARE (increased to reflect 2/3 of the October 31, 2018, balance as approved in the 2018 base rate case;
3) The new flow back of the Historic Mixed Service Deduction proposed to be added in this proceeding;
4) The adjustment to deferred taxes and rate base as a result of the CAMT;
5) The return on the flow backs as they are returned to customers and the change in deferred taxes as a result of the CAMT; and

6) The fixed flowback of the combined Current SHARE and Current Mixed Service deductions to account for the forecasted future deductions.

V. CONSOLIDATED TAX ADJUSTMENT

Q. What is a Consolidated Tax Adjustment?

A. To state it simply, a Consolidated Tax Adjustment ("CTA") is a ratemaking adjustment designed to pass some or all the benefit of tax savings generated by nonregulated subsidiaries of a consolidated return filing group to the regulated affiliate.

Q. What is the Board's policy regarding CTAs?

A. On January 23, 2014, the Board issued an order opening Docket EO12121072, a generic proceeding to review the applicability and computation of the CTA. On November 22, 2014, the Board issued an order ("November 22 Order") in that docket setting out key computational requirements with respect to the CTA. On December 17, 2014, the Board reaffirmed the January 2014 Order. The Board found that it is appropriate to include a Consolidated Tax Adjustment in utility base rate filings and found that the current CTA policy shall remain in effect with the following modifications:

1) The review period for the calculation shall be for five calendar years including any complete year that is included in the test year;
2) The calculated tax adjustment based on that review period shall be allocated so that the revenue requirement of the company is reduced by 100% of the adjustment; and
3) Transmission assets of the EDCs would not be included in the calculation of the CTA.

Q. Have you included a computation of the CTA that is consistent with Board Order?

A. Yes I have. In Confidential Schedule CP–5 R-1, I have provided the detailed computation using the approved Board Order. The resulting CTA reduces rate base by approximately $3 million for electric and $0 for gas. These reductions have been considered in this rate proceeding. Mr. McFadden has included this amount in rate base as shown in Schedule MPM–3 R-1.

Q. Does this conclude your testimony at this time?

A. Yes, it does.

PUBLIC SERVICE ELECTRIC AND GAS COMPANY

CONFIDENTIAL

STATE OF NEW JERSEY
BOARD OF PUBLIC UTILITIES

In the Matter of the Petition of
Public Service Electric and Gas Company
for Approval of an Increase in Electric and Gas
Rates and for Changes in the Tariffs for
Electric and Gas Service, B.P.U.N.J.
No. 17 Electric and B.P.U.N.J. No. 17
Gas, and for Changes in Depreciation Rates,
Pursuant to N.J.S.A. 48:2-18,
N.J.S.A. 48:2-21 and N.J.S.A. 48:2-21.1, and
for Other Appropriate Relief

BPU Docket Nos. ER23120924 & GR23120925

DIRECT TESTIMONY
OF
MICHAEL J. ADAMS
9+3 UPDATE

Submitted on Behalf
of
PUBLIC SERVICE ELECTRIC AND GAS COMPANY

April 15, 2024
P-8 R-1

TABLE OF CONTENTS

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
MICHAEL J. ADAMS
SENIOR VICE PRESIDENT, CONCENTRIC ENERGY ADVISORS, INC.

I. INTRODUCTION AND WITNESS QUALIFICATIONS

Q. Please state your name and business address.

A. My name is Michael J. Adams. My business address is 293 Boston Post Road West, Suite 500, Marlborough, Massachusetts 01752.

Q. By whom are you employed and in what position?

A. I am a Senior Vice President with Concentric Energy Advisors, Inc. ("Concentric").

Q. Please describe Concentric.

A. Concentric is a management consulting and economic advisory firm focused on the North American energy and water industries. Concentric specializes in regulatory and litigation support, transaction-related financial advisory services, energy market strategies, market assessments, energy commodity contracting and procurement, economic feasibility studies, and capital market analyses and negotiations.

Q. What are your responsibilities in your current position?

A. As a Senior Vice President my responsibilities include assisting clients in identifying and addressing business issues. My primary areas of focus have been regulatory-, financial- and accounting-related issues.

Q. Please describe your education.

A. I have an MBA from the University of Illinois – Springfield and a Bachelor of Science in Accounting from Illinois College. I am a member of the American Institute of Certified Public Accountants and the Illinois Society of Certified Public Accountants.

Q. Please describe your qualifications.

A. I have over thirty-five years of direct experience in the public utility industry. I have worked for an investor-owned utility, a regulatory agency, and most recently as a consultant to the energy industry. I have managed and/or participated in a wide variety of consulting engagements. A statement of my background and qualifications is attached as Schedule MJA-LL-1.

Q. Have you ever testified in a regulatory proceeding?

A. Yes. I have provided expert testimony or reports before the Arizona Corporation Commission; Arkansas Public Service Commission; the Connecticut Public Utilities Regulatory Authority, the Federal Energy Regulatory Commission (FERC); the Georgia Public Service Commission; the Hawaii Public Utilities Commission; the Idaho Public Utilities Commission; the Illinois Commerce Commission; the Kentucky Public Service Commission; the Maine Public Utilities Commission; the Maryland Public Service Commission; the Massachusetts Department of Public Utilities; the Missouri Public Service Commission; the Montana Public Service Commission, the New Hampshire Public Utilities Commission; the New Mexico Public Regulation Commission; the State of New Jersey Board of Public Utilities; the Oklahoma Corporation Commission; the Ontario Energy Board; the Pennsylvania Public Utility Commission; Public Utilities Commission of the State of South Dakota; the Tennessee Public Utility

Commission; the Texas Public Utility Commission; the Virginia State Corporation Commission; and the West Virginia Public Service Commission.

My testimonies typically address issues related to affiliate transactions, cash working capital, cost of service/revenue requirement, shared services, accounting, cost allocations and/or regulatory policies and practices.

II. PURPOSE AND SCOPE

Q. What is the purpose of your direct testimony?

A. I have been asked by Public Service Electric and Gas Company ("PSE&G" or the "Company") to prepare and discuss a lead-lag study that was used to develop Cash Working Capital ("CWC") factors that were ultimately used to calculate the cash working capital requirements for the Company's electric and gas operations. I also discuss the analysis of the Company's net assets and liabilities, which are a separate source of working capital. The Company has included the results of the lead lag study and the net asset and liabilities analyses in its rate base. Discussion of the studies follow.

III. CASH WORKING CAPITAL

Q. Please define what you mean by the phrase "cash working capital requirement."

A. The cash working capital requirement is the amount of funds the Company is required tomaintain on hand to finance the day-to-day operations of the Company.

Q. Are you sponsoring any schedules in this proceeding related to your analysis of pseg's cash working capital requirement?

A. Yes. Schedules MJA-LL-2 through MJA-LL-3 set forth the results of the lead lag study and Net Assets and Liabilities analyses, respectively. Schedules MJA-LL-6 to -MJA-LL-18 are the workpapers supporting the lead-lag study and Net Assets and Liabilities analyses, respectively. The schedules were prepared under my direction and supervision and are accurate and complete to the best of my knowledge and belief.

IV. LEAD-LAG STUDY

Q. For what period was the lead-lag study performed?

A. The lead-lag study analyzed the Company's cash transactions and invoices for the twelve months ended December 31, 2022. The leads and lags were applied to expense amounts for the Test Year.

Q. How should the results of the cash working capital analysis and the net assets and liabilities be treated for ratemaking purposes?

A. The cash working capital requirements calculated using the CWC factors from the lead-lag study and the results of the net assets and liabilities analyses should be included as part of PSE&G's electric and gas operations rate base for ratemaking purposes.

Q. Is the analysis of the revenue lags and expense leads typically referred to as a lead-lag study?

A. Yes. Cash working capital requirements are typically determined by lead-lag studies that are used to analyze the lag time between the date customers receive service and the date the customers' payments are available to the Company. This lag is offset by a lead time during which the Company receives goods and services but pays for them at a later date. The "leads" and "lags" are both measured in days. The dollar-weighted lead and lag days are then divided by 365 to determine a daily CWC factor. The CWC factor is multiplied by the appropriate annual test year cash expenses to determine the amount of cash working capital required for operations. The resulting amount of cash working capital is included as part of the Company's rate base. The test year operating expenses to which the leads and lags were applied in this proceeding are described in the testimony of Company witness Mr. McFadden.

Q. What are the various leads and lags that were considered in the cash working capital analysis?

A. Two broad categories of leads and lags were considered: 1) lags associated with the collection of revenues owed to the Company ("revenue lags"); and 2) lead times associated with the payments for goods and services received by the Company, as well as the various taxes and other expenses paid by the Company ("expense leads").

Q. What is a revenue lag?

A. A revenue lag refers to the elapsed time between the delivery of the Company's product (i.e., electricity and/or gas) and its ability to use the funds received as payment for the delivery of the product.

Q. What is an expense lead?

A. An expense lead refers to the elapsed time from when a good or service is provided to the Company to the point in time when the Company pays for the good or service and the funds are no longer available to the Company.

Q. What was the source of information you employed to determine the leads and lags in your cash working capital analysis?

A. Information from the Company was utilized, including data from Accounts Receivables, Accounts Payable, Customer Service, Human Resources, Payroll, and Tax systems. The information derived from these sources, together with the analysis of specific transactions, led to the determination of the appropriate number of lead-lag days for PSE&G's New Jersey electric and gas operations.

A. Revenue Lag

Q. How was the revenue lag determined?

A. The revenue lag measures the number of days from the date service was rendered by the Company until the date payment was received from customers and such funds were deposited and available to the Company. In the calculation, the revenue lag was divided into four distinct components: 1) service lag; 2) billing lag; 3) collection lag; and 4) bank float. An explanation of each component of the revenue lag follows.

Q. What is meant by service lag?

A. The service lag refers to the number of days from the mid-point of the service period to the meter reading date for the service period. Using the mid-point methodology, the service lag was determined to be 15.21 days (365 days in the year divided by 12 months divided by 2).

Q. What is meant by billing lag?

A. Billing lag refers to the average number of days from the date on which the meter was read until the customer was billed. The billing lag was determined by analyzing the Company's monthly billing schedules and meter reading records. The average billing lag was determined to be 1.72 days. Refer to Schedule MJA-LL-6 for the calculation of the billing lag.

Q. What is meant by collection lag?

A. The collection lag refers to the average amount of time from the date when the customer received a bill to the date that the Company received payment from its customer. For purposes of the cash working capital analyses, the Company's actual customer receivables during the twelve months ended September 30, 2023 were analyzed to determine the collection lag. Based on weighted average data from the Company and by considering accounts receivables balances by days aged, the average collection lag was determined to be 50.65 days. Due to potential impacts from the pandemic during the test period of the study, the twelve months ended September 30, 2023 was used to reflect current customer payment patterns post-pandemic.

Q. Explain the calculation of the Company's collection lag.

A. The Company's monthly accounts receivable data was categorized into aging "buckets" of 0-30 days, 31-60 days, 61-90 days, 91-120 days and 120+ days outstanding. For purposes of calculating the collection lag, it was assumed that the customers will pay their bills ratably over the month. Therefore, the midpoint of the first month was determined to be 15 days (*i.e.*, 30 divided by 2). The same assumption that customers will pay their bills ratably over the course of the month was applied to each aging bucket. It was further assumed that customers will pay their bills ratably over the course of the second month (the month that is 31-60 days after the bill was issued). Therefore, the midpoint of payments received 31-60 days after the bill was issued is 45 days (*i.e.*, 30 days outstanding from the first month plus the 15-day midpoint of the second month = 45 days). This same theory applies to the use of 75 days for payments that were received 61-90 days after the bill is issued as well as the use of 105 days for the 91-120 days period. Receivables outstanding for 120 days or longer were conservatively capped at 120 days. The accounts receivable dollars in each bucket were then multiplied by the midpoint of each bucket to calculate the collections lag. Refer to Schedule MJA-LL-7 for the calculation of the collections lag.

Q. What does bank float represent?

A. Bank float represents the elapsed time from when customers' payments were deposited at the bank to when such funds were available to the Company. Based upon an analysis of the availability of deposited funds in the months of February, March and April 2022, the bank float was determined to be 0.92 days. Refer to Schedule MJA-LL-7 for the calculation of the bank float lag.

Q. Please summarize the calculation of revenue lag days.

A. The overall revenue lag, by lag component, is summarized in the following table.

Revenue Lag by Component	
Service Lag	15.21
Billing Lag	1.72
Collections Lag	50.65
Bank Float	0.92
Total Lag	**68.50**

Q. Has the Company included Energy Sales Taxes in its revenues when determining its total revenue requirement?

A. Yes. New Jersey energy sales taxes are included as a separate line item added to the revenue requirement in the determination of the total revenue requirement. The New Jersey energy sales tax is included as part of the revenue requirement lag. Customers are billed the Energy Sales Tax, known as the Sales and Use Tax (SUT), by the Company and the Company remits the charges to the State. The Company is required to remit these dollars to the State in advance of their collection and the timing difference between the remittance to the State and the collection from customers represents a working capital requirement.

B. Expense Leads

Q. What expense-related leads were considered in the lead-lag analysis?

A. Lead times associated with the following expense categories were considered in the lead-lag study: a) Salaries and Wages; b) Incentive Compensation; c) Pensions and Employee Benefits; d) Other O&M; e) Purchased Power and Gas Supply Costs; f) Taxes Other than Income Taxes; g) Federal and State Income Taxes; h) Interest on Long-Term Debt; i) Service Company Expenses; j) New Jersey Energy Sales Tax; and k) depreciation and amortization expense and operating income.

Q. Provide an explanation of the expense lead associated with the Company's salaries and wages including incentive compensation.

A. Considering PSE&G's various payroll periods (i.e., weekly and bi-weekly) and incentive compensation paid to employees, the salaries and wages expense lead was determined to be 25.38 days. Refer to Schedule MJA-LL-8 for the calculation of the salaries and wages expense lead.

Q. What employee benefits does the company provide to its empoyees and what are the expense leads associated with such benefits?

A. The Company provides benefits for its employee associated with medical, dental, group life insurance, disability (short-term disability and long-term disability), workers' compensation, other post-employment benefits ("OPEB"), pension and 401(k) matching. Using the amounts paid/contributed by the Company, the timing of the payments, and the period each payment was applied for each benefit category, the dollar-weighted expense lead for each of the benefits was determined to be as follows: medical 12.86 days; dental 2.94 days; group life insurance 15.03 days;

short-term and long-term disability 45.89 days; OPEB 0 days; pension 15.17 days; 401(k) matching 12.57 days and workers' compensation 1.63 days. Refer to Schedule MJA-LL-9 for the calculations of the individual employee benefits expense leads.

Q. What are "other O&M expenses" and how was the expense lead calculated for such expenses?

A. The Company engages in transactions with vendors for a variety of purposes including facility maintenance, system maintenance, customer service, as well as other services. Accounts payable data was analyzed in order to calculate a lead time associated with the payment for services related to other O&M activities. The analysis indicated that on average, invoices were paid by the Company 36.10 days after receipt. Where appropriate, this lead time includes a service lead time. Refer to Schedule MJA-LL-10 for the calculation of the Other O&M expense lead.

Q. What expense lead was applied to purchased power in the study?

A. The Company purchases power from two separate groups: Basic Generation Service ("BGS") suppliers and Non-Utility Generators ("Purchased Electric Power"). BGS is the Company's default supply obligation for all its customers that do not choose to obtain electric power from a third-party supplier. Purchased Electric Power requires the Company to purchase power from qualifying facilities that generate less than 20MW. Based on an analysis of the service periods and payment dates for the Company's purchase of power from the two separate groups during the period examined, a weighted expense lead of 35.83 days was determined. Refer to Schedule MJA-LL-11 for the calculation of the purchased power expense lead.

Q. What is the expense lead time associated with the Company's Natural Gas Expenses?

A. The Company purchases natural gas for distribution to its gas customers. Based on an examination of the service periods and payment dates for the Company's purchases of natural gas, a weighted expense lead time of 35.63 days was determined. Refer to Schedule MJA-LL-12 for the calculation of the natural gas expense lead..

Q. What are the various general taxes considered in the Cash working capital analysis?

A. The following general taxes were considered in the study: a) Real Estate Taxes; b) Payroll Taxes; and c) Newark City Tax. Each of the taxes are described below.

Q. Explain the lead days associated with each type of general taxes in the cash working capital analysis.

A. The treatment of each category of general taxes in the study is described below:

Real Estate Tax: The Company makes payments to various taxing authorities in the State of New Jersey. Taking the periods for which the tax is assessed, as well as the timing of the actual payment dates and amounts into consideration for the property tax payments, a dollar-weighted expense lead of negative 39.09 days was determined. Refer to Schedule MJA-LL-13 for the calculation of the Real Estate tax expense lead.

Payroll Tax: Based on an analysis of the pay periods and dates for the Company's payment of payroll taxes (FICA, social security/medicare, federal and state unemployment taxes), a weighted expense lead of 16.96 days was determined. Refer to Schedule MJA-LL-13 for the calculation of the Payroll tax expense lead.

Newark City Tax: Residents of Newark pay a flat city income taxon earned income in addition to the New Jersey state income tax and federal income tax. Non-residents who work in Newark also pay a local income tax. This tax is imposed on employers. Based on the periods for which the tax is assessed, as well as the timing of the actual payment dates and amounts taken into consideration for the Newark City Tax a dollar-weighted expense lead of 75.46 days was calculated. Refer to Schedule MJA-LL-13 for the calculation of the Newark City tax lead.

Taking the above into account, a weighted average expense lead of 6.95 days was calculated for taxes other than income taxes.

Q. How did your study address federal income taxes?

A. The lead time associated with federal income tax payments was based on the provisions of the Internal Revenue Code which requires estimated tax payments of 25 percent of total income taxes due each quarter of the current year. The first quarter payment is due by April 15th, while the second, third and fourth quarter payments are due on June 15th, September 15th, and December 15th, respectively. Taking this schedule into consideration a lead time of 37.88 days for federal income taxes was determined. Refer to Schedule MJA-LL-14 for the calculation of the federal income tax expense lead.

Q. How did you address state income taxes?

A. The expense lead for state income taxes was calculated based on the statutory tax due dates for Corporation Business Tax. Estimated payments are due on the 15th day of April, May, June, and December. This resulted in a calculated expense lead of negative 47.25 days. Refer to Schedule MJA-LL-14 for the calculation of the state income tax expense lead.

Q. Please describe how lead times associated with the Company's long-term interest expenses were addressed by the study.

A. The Company made semi-annual interest payments on its long-term debt throughout the test year. Using the midpoints of the semi-annual service periods, a dollar-weighted lead of 91.8 days for long-term interest payments was determined. Refer to Schedule MJA-LL-15 for the calculation of the interest expense lead.

Q. Provide a description of how service company expenses were addressed by the study.

A. Using the monthly invoices for charges to PSE&G from PSEG Services Corporation, a weighted-average service company expense lead of 35.91 days was determined. Refer to Schedule MJA-LL-16 for the calculation of the service company expense lead.

Q. How did your study address New Jersey energy sales tax?

A. "Charges for utility service provided and usually billed by New Jersey's public utility energy companies also are subject to the 6.625% New Jersey Sales Tax. These charges have been fully subject to the New Jersey Sales Tax since January 1, 1998".[1] The lead time for the New Jersey energy sales tax was calculated based on the midpoint of the tax liability period to the payment date, weighted by the actual amount paid. This resulted in a lead time of negative 48.71 days. Refer to Schedule MJA-LL-17 for the calculation of the New Jersey Energy Sales tax expense lead.

---

[1] New Jersey Treasury, Division of Taxation. NJ Division of Taxation - New Jersey Sales and Use (state.nj.us)

Q. Did you include depreciation, amortization, and deferred tax expense in the lead-lag study?

A. Yes. PSEG has historically been authorized to apply an expense lead to expenses such as depreciation, amortization, and deferred tax expense. When these expenses reduce rate base, the Company is deprived of the return that investment in rate base affords. If there is a lag between the reduction in rate base and the receipt of revenues recovering the expense, a carrying cost is incurred by the Company for the time of the lag. As such, it is appropriate for these expenses to be part of a working capital allowance.

The lead-lag study includes depreciation, amortization, and deferred tax expenses with an expense lag of 15.2 days (i.e., based on the mid-month convention, 365/12/2). There remains a lag between when assets in rate base are reduced through depreciation and when the Company receives cash from ratepayers for services provided. Therefore, it is appropriate for the Company to be compensated for the use of cash to keep the Company whole.

Q. Was the topic of including depreciation in cash working capital a topic addressed by Robert L. Hahne in "Accounting for Public Utilities"?

A. Yes, it was.

Q. Please describe how Mr. Hahne concluded that depreciation should be handled in a lead-lag study.

A. Mr. Hahne stated as follows: [2]

> Depreciation expense reflects a zero lag. This zero lag is a noncash charge and therefore cannot produce a need for cash working capital.[3]

---

[2] *Accounting for Public Utilities*, Hahne, Robert L., Chapter 5, Section 5.04, Cash Working Capital.

[3] Id.

This noncash treatment is based on the assumptions that there is no cash outlay associated with depreciation costs that investor funding is not required to pay these expenses. In fact, there was a related cash outlay when the properties were built. The sequence of events is as follows:

1. Investor funds are expended to construct a facility;
2. The facility is used to provide services with concurrent recording of a portion of the costs as depreciation expense;
3. Customers are billed for the depreciation costs incurred; and
4. Customers pay their bills with cash outlays by investors, ends with cash recovery by investors. In the interim, investors are funding the provision of utility services, and such funding must be recognized in rate base.

As the expenses are recorded, equal revenues are *recoverable* from ratepayers as reimbursement to investors and the accumulated provisions are deducted from rate base. The rate base reduction presumes that *recovery* of the recorded depreciation reserves has occurred. If the presumed recovery actually existed, there would be no justification for inclusion of the depreciation expense in cash working capital. The *recovery* assumption, however, is not correct. When the depreciation expense is recorded, the recovery is in the form of an increase in the accounts receivable from customers. The expense is recorded in one period. The actual recovery occurs later (after the service, billing, and collection period recognized in other lead-lag components). In the interim, the investor has not realized the recovery of capital that is imputed by the deduction of recorded depreciation expense. The funds due and payable to investors are being held by ratepayers, and the ratepayers should reimburse the investors for the time value of unpaid amounts due.

Q. Has the BPU Historically included depreciation in the determination of regulated utilities' cash working capital requirements?

A. Yes. The BPU has historically approved the inclusion of depreciation in the determination of cash working capital. The Company's inclusion of depreciation in the determination of its cash working capital requirement is consistent with the BPU's previous treatment and decisions.

Q. If depreciation expense were correctly included in the cash working capital requirement, as you have proposed, is the Company's depreciation expense being recovered via the proposed cash working capital allowance?

A. No. Depreciation expense is **not** being recovered via the cash working capital allowance, nor is there a double recovery of the expense. It is merely the timing difference that by appropriately including depreciation in the cash working capital determination allows investors the opportunity to be fully and fairly compensated for investment in utility assets from the time cash is expended until the time cash is recovered from customers. The Board has hitorically approved the inclusion of non-cash items in the lead-lag study, such as depreciation expense.

Q. Is it your recommendation that the Company should be permitted to include depreciation expense in the cash working capital analysis at zero expense lead, as the BPU has allowed in prior rate proceedings?

A. Yes, it is. Such treatment is consistent with past BPU practice.

Q. Is it your recommendation that the Company should be permitted to include amortization in the same manner as depreciation?

A. Yes, it is. Including amortization expense and assigning a zero lead to the expense recognizes that investor funding occurred but it has not yet been recovered from customers.

Q. How was operating income treated in the lead-lag study?

A. Operating income was included in the lead-lag study with an expense lead of zero days.

Q. Please explain why operating income was included in the study with a zero day lead.

A. A zero day lead was assigned to operating income, or return on invested capital, because operating income is earned when service is provided to the Company's customers, and belongs to investors when earned. As shown in the calculation of the revenue lag, operating income is not collected when earned. Therefore, a zero day lag was assigned to operating income to reflect that the Company's income has not been recovered from customers.

Q. How was pension and OPEB expense treated in the cash working capital analysis?

A. The OPEB expense in the lead-lag study is calculated using a zero-day expense lead, because the ratepayer is receiving a benefit from PSE&G's inclusion of the net OPEB liability in the Net Assets and Liabilities analyses. Since part of pensions and OPEB are included in the Net Assets and Liabilities Analyses, Concentric considered how these expenses are booked and reflected in operating expenses. The lead days for pension expense do not include the cash contributions to the trust because the cash contribution is included in the Net Assets and Liabilities Analyses. The pension expense that is booked and reflected in operating expenses has a 15.17 lead day.

Q. Based upon the results of the lead-lag study and the level of expense sponsored by the company, what level of cash working capital requirements should be included in PSE&G's rate base?

A. PSE&G's cash working capital requirement was determined to be $536,788,596 for PSEG's electric operations. The cash working capital requirement for PSEG's gas operations is $324,760,756.

V. NET ASSETS AND LIABILITIES

Q. What does a net assets and liabilities analysis measure and how is it measured?

A. Under a net assets and liabilities analysis, certain liabilities are subtracted from particular assets. The difference in the liabilities and the assets is assumed to be the working capital requirement.

Q. What are the results of PSE&G's net assets and liabilities analyses?

A. Under a net assets and liabilities analysis, the assets require working capital while the liabilities are sources of working capital. The amounts in the selected assets and liabilities accounts are shown in Schedule MJA-LL-3. The amounts in these accounts were not considered when analyzing the leads and lags for operating expenses, but they have a direct relationship with the electric and gas distribution rate base of PSEG. The amounts included in current assets are other accounts receivable, special deposits, other prepayments, miscellaneous deferred debits and other post-retirement benefits.

Other miscellaneous accounts receivable are predominantly damage claims related to electric pole repairs, and other receivables such as billings for reimbursable repair work. Such expenditures are required to be made in the day-to-day operations of the Company, but are not charged to utility operations and therefore, were not included in the lead-lag study. These expenditures are eventually reimbursed by the State or other agencies. There is, however, a continuing working capital investment required for such expenditures until reimbursement is received.

Post-retirement benefits represent the asset/liability associated with the expense recognition of SFAS 106 and the associated recovery of costs from customers. This has significantly increased the Other Post Retirement Benefits net asset/liability since the conclusion of the Company's last BPU approved base rate case and is primarily due to the liability account decreasing since 2018 by approximately $800 million. See the testimony of Company witness Mr. McFadden for details on ways the Company has reduced its liability.

Energy Sales Tax and prepayments to the State of New Jersey for annual sales tax liability have been excluded from this analysis as they are included in the lead-lag study. The only prepayment included in this analysis is credit facilities fees. Special deposits represent the Company assets created as a result of the cumulative effect of annual pension funding in excess of SFAS No. 87 (pension accounting) expense and the timing of non-qualified pension costs.

The liability section of Schedule MJA-LL-3 includes the recognition of OPEB benefits as previously discussed.

The majority of the accounts payable amount reflects the recording of payables for contractors and other material and supply ("M&S") inventories. Since the other M&S balance is included as a separate component of Working Capital, it is necessary to reduce Working Capital requirements by the amounts included in other M&S inventory, which have not been paid.

PSE&G's net assets and liabilities analysis, as shown on Schedule MJA-LL-3 is $348,093,735 for electric and $261,255,338 for gas.

VI. CONCLUSION

Q. Does this conclude your direct testimony?

A. Yes, it does.

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
FOR THE TWELVE MONTHS ENDED DECEMBER 31, 2022

(THOUSANDS)

Method (1)	Electric (2)	Gas (3)	Total (4)
1. Amount Required to Recover Cost of Service	$536,789	$324,761	$861,549
2. Net Assets and Liabilities	348,094	261,255	609,349
3. Total Other Cash Working Capital	$884,882	$586,016	$1,470,898

STATE OF NEW JERSEY
BOARD OF PUBLIC UTILITIES

In the Matter of the Petition of Public Service Electric and Gas Company for Approval of an Increase in Electric and Gas Rates and for Changes in the Tariffs for Electric and Gas Service, B.P.U.N.J. No. 17 Electric and B.P.U.N.J. No. 17 Gas, and for Changes in Depreciation Rates, Pursuant to N.J.S.A. 48:2-18, N.J.S.A. 48:2-21 and N.J.S.A. 48:2-21.1, and for Other Appropriate Relief

BPU Docket Nos. ER23120924 & GR23120925

DIRECT TESTIMONY
OF
STEPHEN SWETZ

SENIOR DIRECTOR – CORPORATE RATES AND REVENUE REQUIREMENTS
ON
ELECTRIC COST OF SERVICE AND RATE DESIGN

April 15, 2024
P-9E R-1

TABLE OF CONTENTS

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
STEPHEN SWETZ
SENIOR DIRECTOR – CORPORATE RATES AND REVENUE REQUIREMENTS
ON
ELECTRIC COST OF SERVICE AND RATE DESIGN

Q. Please state your name, affiliation and business address.

A. My name is Stephen Swetz, and I am the Senior Director – Corporate Rates and Revenue Requirements for PSEG Services Corporation. My principal place of business is 80 Park Plaza, Newark, New Jersey 07102. My credentials are set forth in the attached Schedule SS-El.

Q. Please describe your responsibilities as Senior Director - Corporate Rates and Revenue Requirements.

A. In this position I have, among other things, responsibility for the development of rates and tariffs for Public Service Electric and Gas Company ("PSE&G" or "Company").

Q. Have you previously testified in proceedings before the New Jersey Board of Public Utilities ("Board" or "BPU")?

A. Yes. I have both submitted written testimony and testified live before the BPU in a number of proceedings that are identified in Schedule SS-E1 R-1.

SCOPE OF TESTIMONY

Q. What is the purpose of your direct testimony in this proceeding?

A. The purpose of my direct testimony is to support the Company's proposed changes to its rates for Electric Service, which are designed to recover the revenue requirements for the electric distribution business as presented in this filing. My testimony provides the Company's embedded cost of service study ("Company COSS") used as the basis for development of the new electric rates and the proposed rate design for each rate schedule in PSE&G's Electric Tariff. I also present an alternative embedded cost of service study ("the Staff COSS") as required under the 2018 Rate Case Order, and explain why that COSS should not be used to set rates in this case.[1]

Additionally, I sponsor other studies and modifications to the Company's Tariff for Electric Service ("Tariff") including the following:

- The establishment of a Storm Recovery Charge ("SRC") to recover major storm costs as a component of a proposed Distribution Adjustment Charge ("DAC") that was previously proposed as part of the COVID-19 cost recovery proceeding;[2]
- The results of Residential and Commercial & Industrial Electric Vehicle ("EV") Cost of Service Studies that were required by the CEF-EV Order.[3] As a result of these COSSs, the Company proposes the following:
    - A Residential Time of Use ("TOU") Program and associated Rate Schedules; and

---

[1] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of an Increase in Electric and Gas Rates and for Changes in Tariffs for Electric and Gas Service, B.P.U.N.J. No. 16 Electric and B.P.U.N.J. No. 16 Gas, and for Changes in Depreciation Rates, Pursuant to N.J.S.A. 48:2-18, N.J.S.A 48:2-21 and N.J.S.A. 48:2-21.1, and for Other Appropriate Relief*, BPU Docket Nos. ER18010029 & GR18010030; *I/M/O the New Jersey Board of Public Utilities' Consideration of the Tax Cuts and Jobs Act of 2017*; BPU Docket No. AX18010001; *I/M/O Public Service Electric and Gas Company for Approval of Revised Rates (Effective on an Interim Basis April 1, 2018) to Reflect the Reduction Under the Tax Cuts and Jobs Act of 2017*, BPU Docket No. ER18030231, Decision and Order Adopting Initial Decision and Stipulation (October 29, 2018) (the "2018 Rate Case Order"), paragraph 25.

[2] *I/M/O the New Jersey Board of Public Utilities Response to the COVID-19 Pandemic*, BPU Docket No. AO20060471, PSE&G filing titled *I/M/O the Petition of Public Service Electric and Gas Company for Approval of Incremental COVID-19 Costs for Recovery Through a New Special-Purpose Clause, and for Authorization to Recover Uncollectible Costs for Gas Through the Societal Benefits Charge* (July 17, 2023).

[3] *I/M/O the Petition of Public Service Gas and Electric Co. for Approval of its Clean Energy Future – Electric Vehicle and Energy Storage ("CEF-EVES") Program on a Regulated Basis*, B.P.U. Docket No. EO18101111, Decision and Order Approving Stipulation (January 27, 2021) ("CEF-EV Order").

    - An optional Direct Current Fast Charge ("DCFC") Distribution kWh Charge to replace corresponding Distribution kW Charges for premises that solely serve DCFC charging facilities;
- Permit residential TOU rates (RLM or proposed RS-TOU) to serve residential EV charging at non-residential premises (such as a detached garage on a residential property);
- Changes to Streetlighting Rate Schedules, which makes Light Emitting Diode ("LED") luminaires the default offering and closes Non-LED luminaires for new installations; and
- Tax Adjustment Credit ("TAC") modifications.

I also sponsor the Company's proposed Tariff, which is attached to the Company's transmittal letter as Schedule 1.

SCHEDULE INDEX

Q. Do you sponsor any schedules as part of your direct testimony?

A. Yes. I sponsor the following schedules that were prepared and/or compiled by me or under my direction and supervision:

SCHEDULE DESCRIPTION	NUMBER
Qualifications of Stephen Swetz	SS-E1 R-1
Basis of Calculations Schedules	
Actual and Weather Normalized Billing Determinants	SS-E2 R-1
COSS Adjustments	SS-E3 R-1
Cost of Service Schedules	
Illustration of Cost Segmentation Methodology	SS-E4 R-1

OVERVIEW OF THE COMPANY'S RATE FILING AND BASIS OF CALCULATIONS AND ANALYSES

Overview

Q. What terminology does your direct testimony use regarding revenue and rates?

A. Throughout this testimony, the revenue or percentage increase for "Distribution" is based only on revenue from the Service Charge and the kilowatt-hour ("kWh") and per kilowatt ("kW") Distribution Charge(s) indicated in the particular rate schedule. The term "Delivery" refers to revenue from the Service Charge and Distribution Charges as indicated on the particular rate schedule, plus the revenue from all of the applicable adjustment clauses. The "Total Bill" equals the Delivery Charges plus electric supply, and is calculated as if all customers were supplied on Basic Generation Service ("BGS").

Q. Please describe the electric distribution services provided by the Company.

A. The Company provides electric distribution services under the following Rate Schedules:

(i) Rate Schedule RS is the Company's primary residential rate schedule;

(ii) Rate Schedule RHS is a closed service that was available to residential customers where electricity was the sole source of heating;

(iii) Rate Schedule RLM is a time of use rate available to residential customers;

(iv) Rate Schedule WH is a closed service that was available to premises with controlled water heating installations;

(v) Rate Schedule WHS is available for controlled water heating storage or for the electric heating elements of a water heating service connected to an active solar collection system;

(vi) Rate Schedule HS is a closed service that was available to permanently installed comfort building heating equipment;

(vii) Rate Schedule GLP is for general purposes at secondary distribution voltages;

(viii) Rate Schedule LPL is for general purposes at secondary voltages where the customer's measured peak demand exceeds 150 kW and also at primary distribution voltages;

(ix) Rate Schedule HTS is for general purposes at subtransmission, transmission and high voltages;

(x) Payment Schedule PEP is applicable to electricity produced from a Qualifying Facility as defined in the Public Utility Regulatory Policies Act of 1978 and delivered to the Company;

(xi) Rate Schedule BPL is service for dusk to dawn street lighting and area lighting to a body politic from Company-owned lighting facilities;

(xii) Rate Schedule BPL-POF is a closed service for dusk to dawn street lighting and area lighting to a body politic from publicly-owned lighting facilities; and

(xiii) Rate Schedule PSAL is service for dusk to dawn private street lighting and outdoor area lighting from Company-owned lighting facilities.

Q. Please provide an overview of the Company's filing in this proceeding.

A. As described more fully by Company witness Mr. Michael McFadden, PSE&G is seeking to increase its base distribution rates by approximately $535 million annually for its electric distribution business. Included in this filing, and as discussed further by Mr. McFadden and Company witness Mr. Cliff Pardo, the Company proposes to make certain modifications to the Company's TAC, including flowing back Mixed Service deductions to customers. This change will reduce electric rates by approximately $88 million annually. In addition, the Company is proposing the SRC to recover major storm costs, increasing rates by approximately $39 million annually. My testimony provides support on how these changes will impact rates.

<u>Residential Rate Affordability</u>

Q. How have your Electric distribution rates changed since the 2018 base rate case?

A. The distribution component of a Residential Electric customer bill for a customer using 7,800 kWh per year has increased at a CAGR of 1.5%, well below the statewide comparable average of 5.0%. and below inflation levels. This modest increase is driven primarily by rate increases from the ES II Program to modernize the Company's electric system and to make it more reliable and resilient.

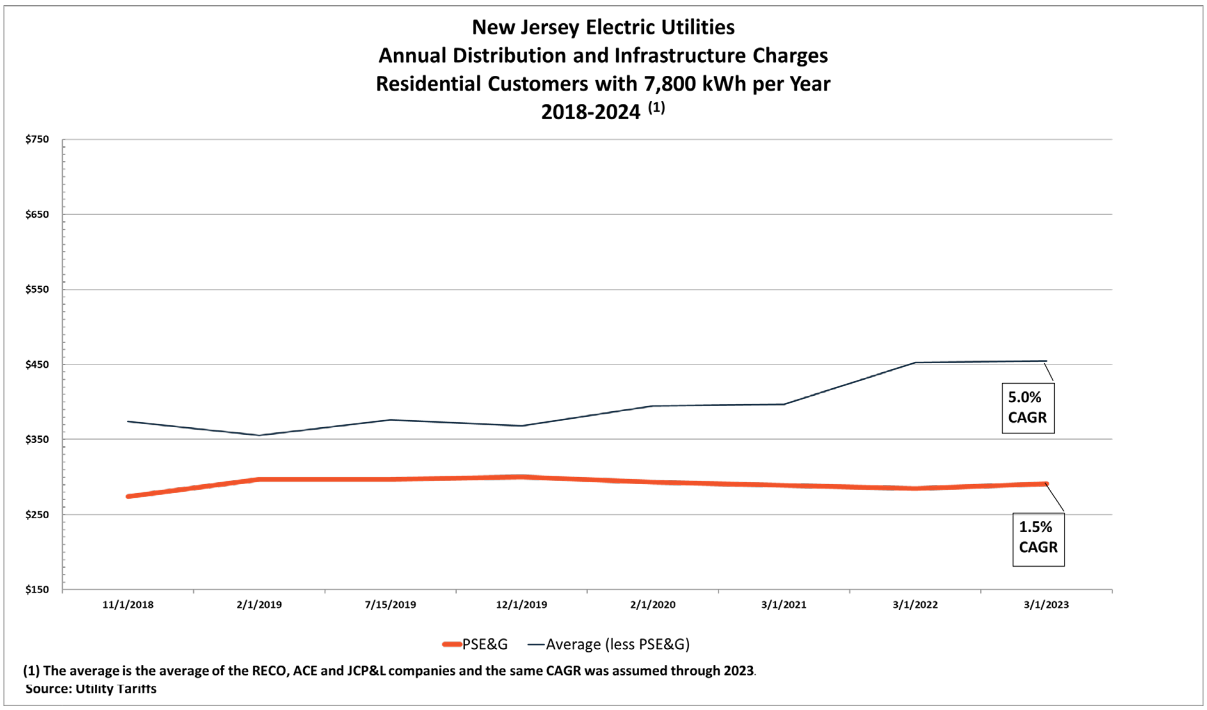

Figure 1

With respect to the Company's electric distribution rates, as can be seen in the chart, applying the State-wide average electric usage of 7,800 kWh per year for a typical residential customer to each utility (even though the average usage for PSE&G's typical residential customer is lower), the distribution portion of the bill for PSE&G, which is the subject of this proceeding, is approximately $291 per year, the second lowest among the State electric utilities and lower than the $455 per year average of the other NJ electric utilities. Further, the Company's compound annual growth rate ("CAGR") of this cost since our last rate case is 1.5%, less than half of the average increase of other New Jersey utilities of approximately 5.0%.

Q. PSE&G's bills are lower on Distribution Charges, but how does PSE&G compare on a total bill basis?

A. PSE&G continues to be lower than the average compared to its peers. In NJ, PSE&G remains on the lower cost side compared to peers in terms of the total electric bill. As shown in Figure 2 below, PSE&G is almost 15% lower than the average.

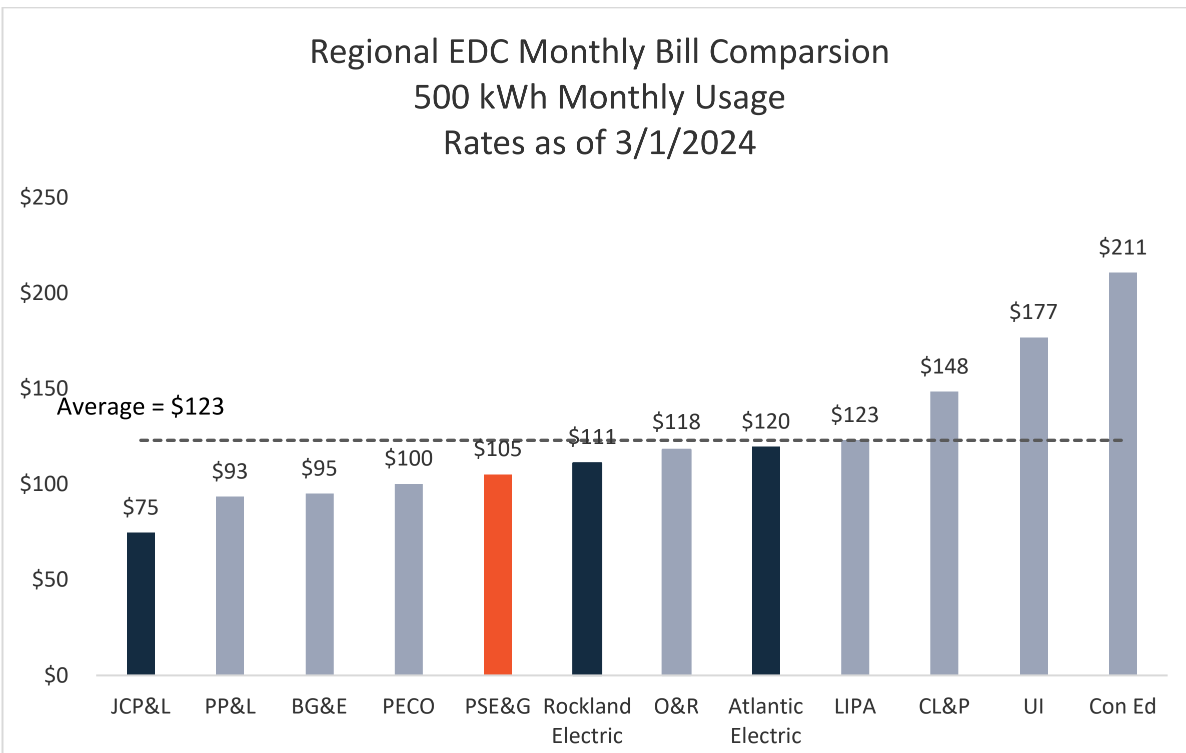

Figure 2

Q. How long has it been since PSE&G's last base rate case?

A. PSE&G filed its last base rate case on January 12, 2018, with new rates effective November 1, 2018. Since that time, every other NJ electric utility has filed at least two base rate cases.

Q. Why has PSE&G not filed a rate case until now?

A. As discussed in more detail below, this is primarily due to the Company's efforts to control costs. PSE&G takes very seriously its responsibility to customers to manage costs prudently and be good stewards of the electric distribution system and the customer funds needed to operate and maintain it effectively. This is achieved by regularly benchmarking Company costs and employee performance and creating appropriate employee incentives to continue to improve upon historic success.

Q. Please describe the efforts the Company has undertaken to protect lower-income customers from the impact of rate increases.

A. The Company is very focused on this vulnerable segment of our customer base. PSE&G's Energy Efficiency programs include incentives targeted to its lower income customers, with specific opportunities for both low and moderate income customers, who often face the highest energy burdens. The Company specifically seeks to provide energy savings opportunities to these customers in order to lower their energy burdens, as participants in the EE programs are expected to benefit from long term energy and bill savings, as well as health and safety improvements. The Company implements the State's Comfort Partners program to customers with incomes up to 250% of the Federal Poverty Level; that program provides free comprehensive energy savings solutions as well as upgrades to address health and safety problems in the home. PSE&G also recently filed its updated Clean Energy Future – Energy Efficiency II Program, which proposes to transfer administration of the Comfort Partners program to the Company in order further reduce market confusion and streamline the process for lower-income customers to take advantage of energy efficiency programs;[4] PSE&G believes this change in administration of the Comfort Partners program will significantly improve customer access to energy efficiency and allow the Company more flexibility in serving the needs of lower-income customers. Also as part of the Clean Energy Future – Energy Efficiency II Program, PSE&G proposed to continue to target low and moderate income customers by providing comprehensive energy assessments and free direct install of energy efficient measures and services to income qualified households with higher incentives and opportunities for no-interest financing for health and safety improvements to these customers (the Comfort Partners program does not include financing, as all measures are paid for by the program and free to eligible customers), and to continue to provide enhanced opportunities for customers in overburdened communities. PSE&G also offers higher incentives for high efficiency heating and cooling systems and continues to provide financial incentives to both property owners and tenants to install high efficiency equipment in apartments and other multifamily properties. The Company promotes the use of these programs to our customers through bill inserts and community outreach, conducting this communication in multiple languages where possible and appropriate.

Q. Are there other assistance programs for lower-income customers outside of PSE&G's energy efficiency programs, and if so, please describe those programs and who is eligible.

A. The Company also advocates at the State and Federal level for various grants provided to lower-income customers, including the Low-Income Home Energy Assistance Program

[4] *I/M/O The Petition of Public Electric and Gas Company for Approval of its Clean Energy Future-Energy Efficiency II (CEF-EE I) Program on A Regulated Basis*, BPU Docket No. QO23120874 (filed December 1, 2023).

("LIHEAP"), Lifeline and Tenants Lifeline Program ("Lifeline"), and the Universal Service Fund ("USF"). LIHEAP is a Federal Block Grant program that helps low-income individuals and households pay for their winter heating bills, medically necessary cooling benefits, and weatherization. The Lifeline Program helps customers pay their utility bills with a $225 annual utility credit. To be eligible, a customer must be at least age 65, or at least age 18 and collecting Social Security Disability. In addition, a single person must make less than $42,000, or a couple less than $49,000 annually. USF is a statewide program administered by the Department of Community Affairs that allows program recipients to pay no more than 3% of their income for electric and 3% for natural gas, or 6% for total electric, including electric heating for customers at or below 60% of the State median income. PAGE is a program for customers earning up to 500% of the Federal Poverty Limits and offers a grant of up to $700 per utility service. NJ SHARES is for customers earning up to 400% of the Federal Poverty Limit and is funded by customer donations which are matched by PSE&G.

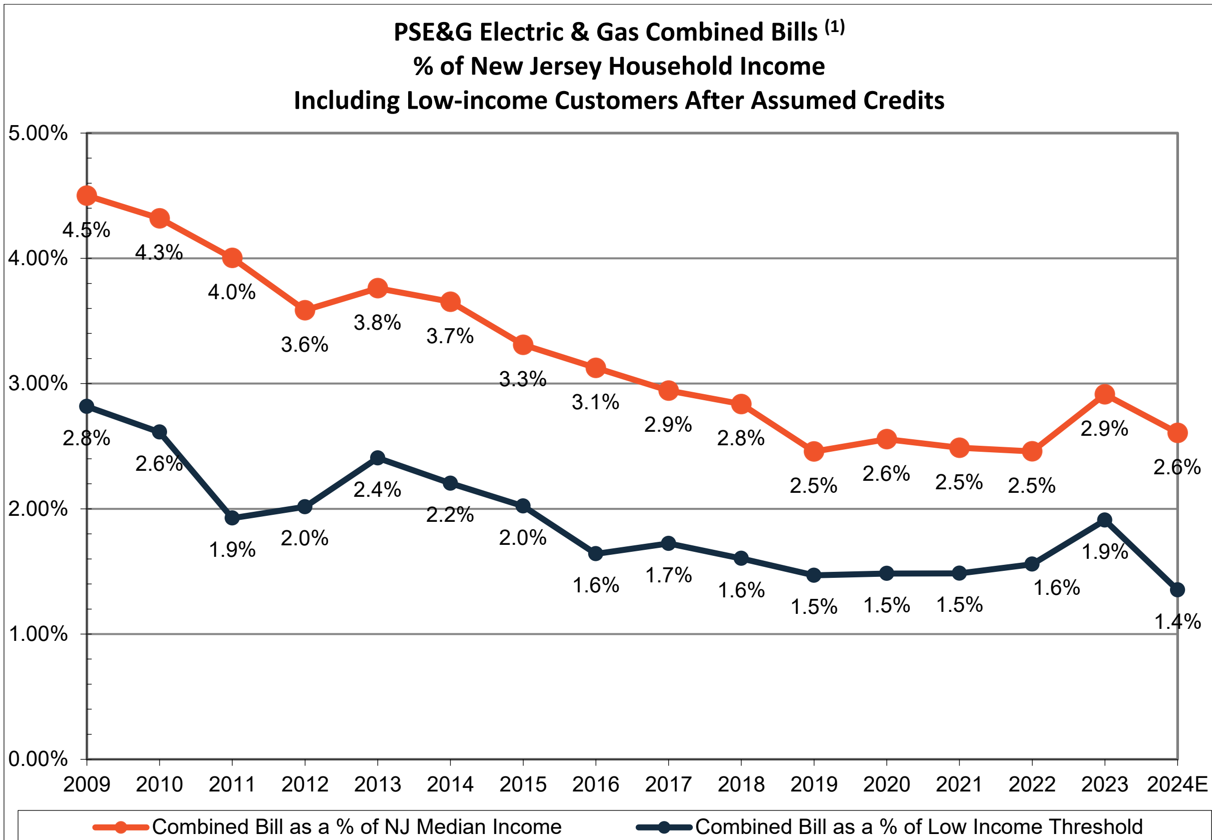
PSE&G has more customers eligible for these low-income programs on a proportionate basis compared with other New Jersey utilities. This customer segment receives special focus.

Q. Are there steps PSE&G has taken during the COVID-19 pandemic to help these customers?

A. Yes. PSE&G, its customers, and New Jersey have faced unprecedented challenges as a result of the COVID-19 global pandemic that created difficult economic circumstances. In response to these challenges, PSE&G developed a comprehensive payment assistance outreach plan utilizing employees and contractors and conducted an external media campaign designed to provide customers opportunities to garner financial assistance and enter into deferred payment arrangements to avoid shut off.

Q. Has the Company considered the impact of electric rates on these customers?

A. Yes. As illustrated in Figure 3 below, the relative cost of PSE&G's services to a typical combined (that is, electric and gas) residential lower-income customer has dropped significantly since 2009 and is essentially flat as compared with rates following the conclusion of the Company's 2018 base rate case.



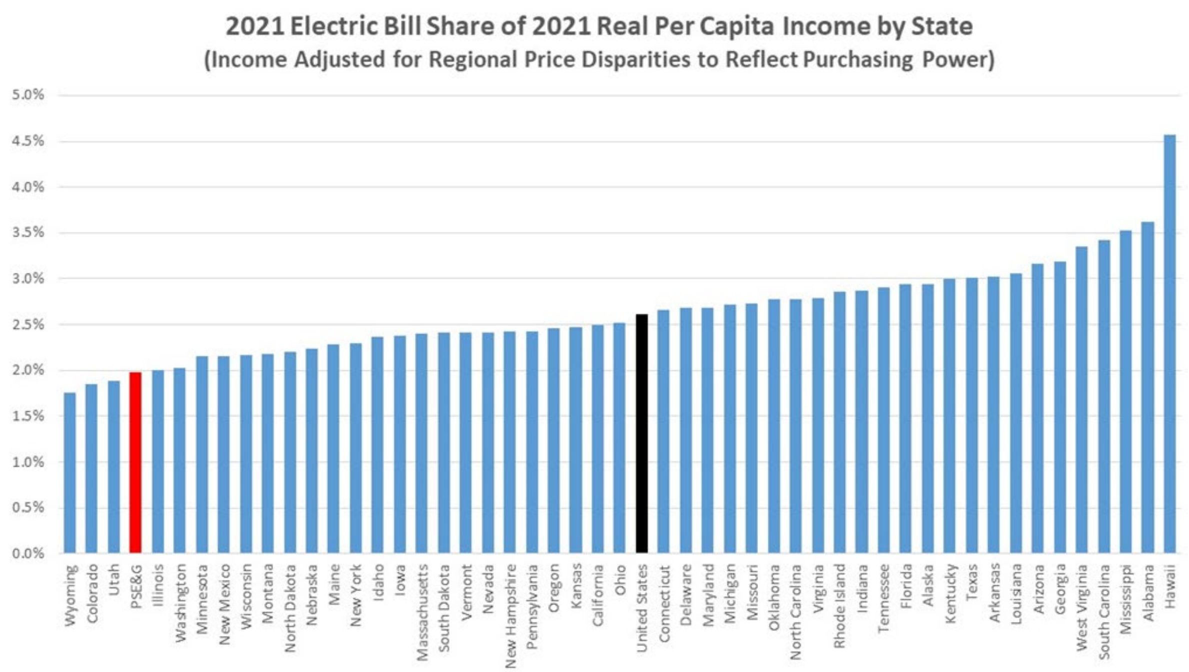
(1) Based on a typical residential electric customer using 740 kilowatt-hours per summer month and 6,920 kilowatt-hours on an annual basis using rates as of June 1 for each year and a typical residential gas heating customer using 172 therms per winter month and 1,040 therms on an annual basis using rates as of January 1 of each year. Notes: NJ Median income source https://fred.stlouisfed.org/series/MEHOINUSNJA646N. 2023 and 2024E are not available, therefore assume 3% annual increase per year over 2022. Income level of USF, the lowest threshold of the three low-income programs, is 175% of the Federal Poverty Line. Assumes the customer also qualifies for LIHEAP and Lifeline. 2022 results were adjusted to normal levels of customer assistance, which was elevated in 2022 due to funds received through the American Recovery Plan.

Figure 3

This chart compares the bill as a percentage of income for a typical combined electric and gas residential customer relative to New Jersey's median income and relative to the income threshold below which customers are considered low-income. As can be seen, for the average residential customer, the cost of service is less than 3% of median income. For lower-income customers, the cost of the bill after LIHEAP, USF, and Lifeline grants relative to an income level of 60% of State median income (the level at which a customer is eligible for these grants), is around 2% today. So, even with this proposed rate increase, the cost of electricity and gas for all of the Company's customers, including low-income customers, remains a very small portion of overall income for those able to take advantage of these programs.

Q. How does this utility bill portion of overall income compare to other states?

A. Very well. As shown in Figure 4 below, PSE&G's residential electric bill as a percentage of per capita income for NJ is in the top quartile compared to the other states in the US. In other words, PSE&G's total bill represents less share of a customer's wallet than the relative utility bill share in most other states.



Source: U.S. Dept. of Commerce, Bureau of Economic Analysis, "Regional Data GDP and Personal Income", June 2023
U.S. Dept. of Energy , Energy Information Agency, "Sales (consumption, revenue, prices & customers", retrieved July 2023.

Figure 4

While PSE&G's bills as a percentage of overall NJ income is very favorable compared to most other states, the Company recognizes the current economic environment and the ongoing need to control costs. PSE&G has and will continue to control costs as much as possible to maintain affordable rates for customers without sacrificing reliability.

Q. How does the current RS Service Charge compare to other utilities?

A. As shown in Figure 5 below, PSE&G's monthly RS electric service charge is the second lowest compared to similar electric utilities in the region.

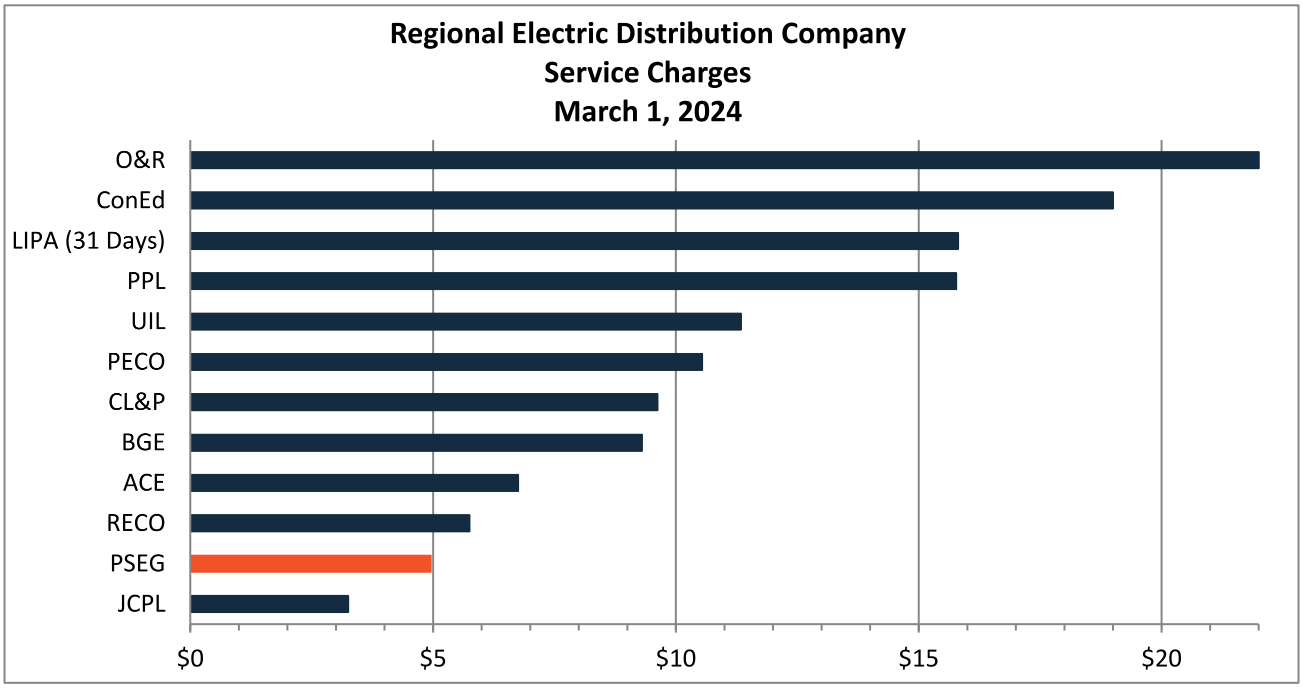


Figure 5

Q. What are the periods used for the COSSs and Rate Design that you are sponsoring in this proceeding?

A. The COSSs presented in this testimony are based upon the period January 1 to December 31, 2022. The only variations from actual costs in the COSS period were the requested overall Rate of Return value, proposed rate base adjustments such as working capital requirements, the proposed *pro forma* adjustments, and adjustments to synchronize the number of customers and usage used in the COSS to those used in the Company's rate design. These adjustments, along with the rate design presented in this testimony, are based upon the Test Year of June 1, 2023 through May 31, 2024 (hereafter "Test Year").

Q. What billing determinants will be used to determine the revenue requirement and rates that are being established in this proceeding?

A. The billing determinants used to establish rates and the revenue requirement allocation for each rate class in this proceeding will be the actual Test Year billing determinants as adjusted for normal weather. For the initial filing and any updates (prior to the final filing) with all actual data, the billing determinants will be a mix of weather normalized actual and forecasted billing determinants. Weather normalized billing determinants are calculated by adjusting actual recorded monthly electric sales to account for the effects of abnormal weather. A summary of the actual billing determinants, the weather normalized billing determinants, and the variation of each determinant from normal for the Test Year period is shown in Schedule SS-E2 R-1.

Weather Normalization of Billing Determinants

Q. What weather pattern is used to weather normalize actual billing determinants?

A. The Company utilizes a twenty-year weather pattern as measured at Newark Liberty International Airport covering the period ended December 31, 2021.

Scope of the Cost of Service Study

Q. Please describe the COSSs that the Company is presenting in this proceeding.

A. The Company is presenting two COSSs in this proceeding – its recommended COSS, referred to as the "Company COSS" – and an additional COSS based on a methodology developed by BPU Staff, referred to as the "Staff COSS." As discussed more fully below, the Company does not support the use of the Staff COSS to establish rates in this proceeding, but is submitting the study in compliance with the 2018 Rate Case Order. The COSSs discussed in this testimony are for the electric distribution portion of the Company's operations. Thus, the COSSs are generally "wires only" analyses for the regulated electric delivery business. They do not include the costs for the Company's Transmission business, which is under the jurisdiction of the Federal Energy Regulatory Commission ("FERC"), nor any electric production or supply costs. Although PSE&G remains responsible to provide BGS, the determination of rates charged to end-use customers for this service are addressed in other proceedings.

<u>Adjustments to Accounting Data</u>

Q. Did you make any adjustments to the accounting data used in the COSSs?

A. Several adjustments to the 2022 accounting data used in the COSSs were necessary prior to its use. These adjustments and the FERC Account associated with each of these adjustments are shown in Schedule SS-E3 R-1.

In the rate design process, the unit charges associated with these adjustments will be added back as appropriate in each rate schedule to assure full recovery of all expenses. The Company COSS and the Staff COSS each include these adjustments to costs and billing determinants.

<u>COST OF SERVICE STUDY ("COSS") OVERVIEW</u>

<u>Introduction</u>

Q. What is the first step in developing new electric rates?

A. The first step in developing new electric rates is the preparation of an appropriate COSS. The Company COSS was used to both separate costs by functional segments and to apportion (or allocate) these segmented costs to the rate classes or sub-classes based upon each class's responsibility for that cost.

Q. What is the objective of an COSS?

A. The objective of the COSS is to measure the cost responsibility of each rate/class and distribution function (functionalization).

<u>Cost Allocation Concepts</u>

Q. Please describe the cost allocation concepts used in the Company's COSS.

A. Inherent in any COSS is the allocation to rate classes of many costs which by their nature are difficult to relate precisely to cost causation. Cost causation describes the cause-and-effect relationship between customer requirements, load profiles, and usage characterization, and the costs incurred by the utility to serve those requirements. Experts will differ on the best way in which many costs should be allocated among customer classes. The key is to determine which approach makes the most sense in terms of best answering the question of what caused the cost, and then to apply the result in a reasoned, balanced manner. At all times, it is important to recognize that the COSS is intended to be a guide to appropriate ratemaking, and that one objective of ratemaking is that the end result should be a reasonable one.

The development of a COSS requires an understanding of the operating characteristics of the utility system. Electric distribution company facilities, such as substations, wires, and transformers, are planned and constructed to provide reliable service on a least-cost basis. distribution planners must design distribution systems with sufficient wire and transformation capacity to meet customers' peak loads while, of course, maintaining safety and reliability.

Each portion of the electric distribution system is nominally designed to carry the expected peak electric loads, without concern for the loadings in other hours or periods of the year. Although it is mathematically possible to develop an allocator of costs based upon virtually any attribute or formula, the use of a method that has little or no relation to the underlying cost causation is simply flawed. If the adopted approach reasonably tracks cost causation and the guidance is applied with a reasoned, balanced view, fair and equitable delivery rates to all classes of delivery customers will be the end result.

As I discuss later, I have used the results from the Company COSS as a guide in developing rates, but tempered the final rate design to provide a reasonable balance between the goal of moving each rate schedule towards costs and the goal of holding the increases to reasonable percentage increases based upon the resulting customer impacts.

General Cost Allocation and Functionalization Methodology

Q. What is the basis for the cost allocation and functionalization methodologies used in the Company COSS?

A. The Company COSS incorporates a method identical to that as used by the Company in its prior electric base case and is based on the concepts and theories recommended in Chapter 6 of the current NARUC Electric Utility Cost Allocation Manual ("NARUC Manual") regarding the classification and allocation of electric distribution plant. Although much has changed in the industry since this document was published, the methodology presented is still valid and relevant to evaluating the costs for today's electric distribution business.

The NARUC Manual outlines the general methodology to be used on page 90 as follows:

> *When a utility installs distribution plant to provide service to a customer and to meet the individual customer's peak demands requirements, the utility must classify distribution plant data separately into demand- and customer-related costs.*

And later on that same page 90:

> *Distribution plant Accounts 364 through 370 involve demand and customer costs. The customer component of distribution facilities is that portion of costs which varies with the number of customers. Thus, the number of poles, conductors, transformers, services, and meters are directly related to the*

number of customer's on the utility's system…each primary plant account can be separately classified into a demand and customer component.

The NARUC Manual then discusses the allocation of the demand related distribution costs on page 97 in the middle of the first paragraph:

The load diversity at distribution substations and primary feeders is usually high. For this reason, customer-class peaks are normally used for the allocation of these facilities. The facilities nearer the customer, such as secondary feeders and line transformers, have a much lower diversity. They are normally allocated according to the individual customer's maximum demands.

Q. What are the fundamentals of classifying and allocating the costs of providing distribution service that are described in the NARUC Manual?

A. The methodology presented in the NARUC Manual presents three key distribution Cost of Service fundamentals for classifying and allocating costs incurred to provide each customer distribution service:

1. Distribution costs have no energy related component
2. The load diversity as experienced by specific facilities or equipment determines the cost allocation method that should be used
3. Poles, conductors, line transformers, services, and meters have a customer component

Q. Please describe these three fundamentals and how they are used in the Company COSS.

A. The first fundamental, the absence of an energy related component, is very basic. With the limited exception of electrical losses, the amount of energy, as measured by kWh consumption, has no impact on the planning, design or installation of any electric distribution plant. Therefore, kWh consumption has not been included in the Company's methodology as the basis of allocation of distribution costs.

The second fundamental, load diversity as experienced by specific facilities or equipment, is somewhat subtle. Electric distribution facilities are designed based on various criteria depending upon the function of each particular piece of equipment.

On one extreme, a piece of equipment that connects a customer to the electric system (such as a service drop) is sized to handle the expected peak load of that customer, regardless of when that peak load might occur. For example, for some residential customers this peak might be a hot summer night when they have their central air conditioner at full power, all the lights in the house are turned on, and the refrigerator is running. For other residential customers without many appliances, the peak might occur on Christmas morning when decorations are lit and the furnace fan on the gas heating unit turns on. Similar effects would be seen for all types of industrial and commercial customers as well, with the occurrence of the peak load varying, in effect, by customer.

On the other extreme, an electric distribution substation is designed to handle the peaks expected at that specific substation at the time of peak demand at that location. At these locations, a customer's peak demand, the number of customers served, or even kWh usage for any specific customer or any combination of customers, is immaterial. The only value that matters is the expected peak demand at that substation. For the Company's service territory, given the combined loads of customers, equipment installed, and the local climate, these peaks are customarily observed in the late afternoon of a hot summer day.

The effect of varying diversity is a continuum between these two extreme points of the electric distribution system. To determine the effects of such variations in load diversity between the substation and the service drop, or to develop a unique cost allocation methodology to account for each different type of diversity of load, would be a vast and impracticable task. In practice, any methodology used must strike a balance between one that is both theoretically ideal and one that can actually be implemented. The methodology presented in this testimony strikes this balance and is consistent with the underlying basis for the installation and design of the distribution system by the Company's distribution planners.

Q. Does the Company agree with the third fundamental identified by NARUC -- that certain facilities such as poles, conductors, line transformers, services, and meters have a customer component?

A. Yes. The Company agrees with the third key point identified in the NARUC Manual, that a portion of distribution facilities are customer related. However, due to the complexities and resources required to perform a study of the portion of facilities that should be classified as customer related, and the likelihood that such a study would show a need for increased residential charges that would far exceed what the Company is proposing in this proceeding, the Company has not undertaken a study to quantify this customer-related portion for this proceeding, but may do so in future rate cases.

Q. How is the PSE&G electric distribution system segmented or functionalized in the Company COSS?

A. As explained in more detail below, the Company COSS segments the electric distribution utility plant into six distinct segments – Access, Local Delivery, System Delivery, Street Lighting, Customer Service, and Measurement. Of these six segments, the Access, Local Delivery, and System Delivery segments are much larger than the other three and form the core of the distribution business.

Q. Please describe the Access, Local Delivery, and System Delivery segments in more detail and provide an overview of how you have allocated the costs of these segments.

A. The Access segment is limited to the electric service drop to individual customers; the Local Delivery segment is comprised of plant that is shared among a small number of customers, and the assets comprising the System Delivery segment serve a large number of customers. Consistent with the second and third NARUC fundamentals discussed above, I have allocated the Local Delivery costs based on the sum of customer individual peak demands. This allocation follows the NARUC cost causation principle that facilities that are electrically close to customers are sized to carry the sum of undiversified customer peak loads.

Because System Delivery facilities are electrically farther from the customers, and see only highly diversified customer demands, I have allocated these facilities' costs solely on the basis of each rate class's contribution to the system peak, or what is termed each rate class's Coincident Peak ("CP"). The sum of customer peaks for Local Delivery costs and rate class CPs for System Delivery costs forms a reasonable basis for the allocation of costs to each rate class because they represent the underlying basis of the cost causation for the type of equipment that comprises each distinct segment.

Because subtransmission and primary circuits have characteristics partially consistent with Local Delivery and partially consistent with System Delivery assets, a cost separation methodology for allocating these costs was developed in consultation with the Company's distribution planners. For subtransmission circuits, the function of which is primarily to distribute power between substations and only secondarily to serve 26 kV customers (on Rate Schedule HTS-subtransmission), an analysis of the loads determined that a 21.1% - 78.9% spilt between the functions of Local Delivery and System Delivery was appropriate.

The function of primary circuits, however, was determined to be more evenly split between providing Local Delivery and System Delivery functions. A primary circuit carries power from a substation to customers who are typically served through transformers along its length. The portion nearest the substation connection has a highly diversified load because it carries the load attributed to all customers on that particular circuit. It thus performs a function similar to that of the substation, and thus could be considered primarily a System Delivery asset and should be largely allocated on the CP of the classes served. On the other extreme, the portion of the circuit that is electrically farthest away from the substation may serve only one customer and must be designed to handle the peak demand of that specific customer, resulting in zero load diversity. It thus could be considered a Local Delivery asset and allocated on the sum of the customer peaks for the classes served. Along the length of the primary circuit, the diversity gradually shifts from the highly diversified load at one end to the undiversified load at the other end. As a result, I have utilized a 50% - 50% split between Local Delivery and System Delivery to segment and allocate all primary circuits' costs as a representation of the average diversity and dual functionality of this equipment.

The remaining segment, the Access segment, is allocated via a special study of the costs of service drops by rate class as discussed more fully below.

<u>Functionalization of the Six Segments</u>

Q. What is the first step in the process of performing an COSS?

A. As the first step in that process, the COSS unbundles total costs into the six distinct functional segments that I previously discussed – Access, Local Delivery, System Delivery, Street Lighting, Customer Service, and Measurement.

Q. Once these functional segments are developed, how are they used?

A. These separate functions (or segments) assist in the development of individual rate schedule components, such as the Service Charge. Once the plant and expenses are functionalized to the proper segment, the allocation process spreads the cost responsibility to the rate classes.

Q. What items are included in each of these segments?

A. The list below describes what is included in each of the six segments:

- The Access segment includes the plant and operation and maintenance ("O&M") costs related to the electric service drop.
- The Local Delivery segment includes all equipment (plant and O&M) related to the local distribution facilities.
- The System Delivery segment includes all equipment (plant and O&M) related to the "bulk" system distribution facilities.
- The Street Lighting segment is limited to the luminaires, brackets, and poles used only for street lighting purposes (the latter termed "street lighting poles").
- The Customer Service segment includes all costs relating to billing, inquiry, sales, service, and collection activity.
- The Measurement segment includes the costs for meter reading, meter plant, and meter O&M.

Q. Are all costs included in these six segments?

A. Yes, all costs are functionalized to one or more of these of six segments.

<u>**Access Segment**</u>

Q. Please discuss the Access segment in greater detail.

A. The Access segment is the initial link between the shared or common distribution system and the customer's own electric system, comprised of the electric service drop whose gross plant is recorded in FERC Account E369. Service drops are illustrated as a thick dashed line on Schedule SS-E4 R-1. The embedded costs for this segment are allocated across the rate classes based on an analysis of current unit costs, determined from typical service drop lengths and wire types as estimated by the Company's distribution planners. In situations where various size services are used to provide service to customers on the same rate schedule but with different peak loads, only the relative cost of the minimum size service is functionalized to this segment. The remainder is functionalized to the Local Delivery Segment for recovery through kWh or kilowatt ("kW") charges and is not included in the costs to be recovered by Service Charges.

Local Delivery Segment

Q. Please discuss the Local Delivery segment in greater detail.

A. As discussed above, the Local Delivery facilities are the portions of the distribution system that are used to serve multiple customers and are also electrically and physically closest to the point of connection with individual customers' service drops. These facilities include the following types of plant:

- All secondary wire other than that used for customer service drops and for street lighting service,
- All line transformers; including all pole top units, pad mounts, underground, and network transformers,
- 21.1% of the Company's 26 Kilovolt ("kV") circuits - including poles, conductors and devices (only applicable to customers served at subtransmission voltages),
- 50% of the Company's primary circuits - including poles, conductors, and devices, and
- The portion of the service drop and meters in excess of the relative minimum amounts.

Although many customers share these facilities, the load carrying capacity of individual transformers, lines, and circuits is driven primarily by the sum of the undiversified peak demand of individual customers. Therefore, the majority of investment in the Local Delivery segment has been allocated to the rates based on the sum of the customers' individual peak demands.

As I have previously mentioned, although the Company agrees with NARUC that a portion of these facilities is customer-related and should be allocated based on the number of customers served, it is not proposing an allocation method based on this fundamental in this proceeding but may do so in future rate case proceedings. The outcome of such an allocation study would likely indicate that residential customers cause a higher proportion of costs than indicated by the methods used in preparing the Company COSS.

Investment in line transformers was allocated to the rate classes based on the average embedded costs, on a dollar per kVA basis, that were derived from a study that linked the actual transformer serving each customer with the Company's accounting records. This study is provided in the workpapers that support this testimony. Facilities related to the Local Delivery segment are illustrated as a thin solid line on Schedule SS-E4 R-1. A detailed discussion of the segmentation and allocation of each FERC Plant Account related to this segment is discussed in Appendix-E1.

<u>System Delivery Segment</u>

Q. Please discuss the System Delivery segment in greater detail.

A. The System Delivery segment is used for the portions of the distribution system that are planned to meet large, very diversified loads from many sizes, classes, and types of customers. Thus, this segment is composed of the portion of the distribution system facilities that is electrically farthest from individual customers and is sometimes referred to as the bulk distribution system. It is comprised of the following type of facilities:

- Switching stations and substations (the distribution portions only),

- 78.9% of the Company's 26 kV circuits - including poles, conductors, and devices, and
- 50% of the Company's primary circuits - including poles, conductors, and devices.

The costs for these System Delivery facilities are allocated across applicable rate classes based on the classes' contribution to the system CP, because the CP criteria is used as the planning criteria for this type of investment. Facilities relating to the System Delivery segment are illustrated as a thick solid line on Schedule SS-E4 R-1. As with the prior segment, a detailed plant-by-plant discussion of the segmentation and allocation is discussed in Appendix-E1.

Street Lighting Segment

Q. Please discuss the Street Lighting segment in greater detail.

A. This segment comprises the investment for street lighting luminaires, street lighting poles (poles used exclusively for street lighting), and other miscellaneous devices such as street lighting brackets and/or shrouds, and all associated O&M expenses for this equipment. Where a pole is used solely to provide street lighting, termed a "street lighting pole," one section of secondary wire was also segmented to this function for each pole so identified.

All investment and expenses in the Street Lighting segment were directly assigned to the three street lighting Rate Schedules of BPL, BPL-POF, and PSAL based upon the number and type of lights and poles billed under each rate schedule.

Customer Service Segment

Q. Please discuss the Customer Service segment in greater detail.

A. This segment encompasses all costs related to Customer Service type functions, such as costs related to billing, payment receipt and processing, collection activity, and other account maintenance type costs, with the exception of meter reading costs, which are included in the Measurement segment. These costs are allocated to the rate classes based upon a separate study of Customer Service functions.

Measurement Segment

Q. Please discuss the Measurement segment in greater detail.

A. This segment includes costs for meter reading and the investment and O&M related to the meters themselves. Meter reading costs are allocated to the rate classes based upon a separate embedded cost analysis of Customer Service functions. Given that new Advanced Metering Infrastructure ("AMI") meters are relatively the same cost for customers in each rate class, the meter investment is allocated across the rates based upon the relative installed cost of new meters.

Modeling Procedures

Q. Please describe the COSS modeling procedures as well as how all COSS items are segmented and functionalized.

A. The COSS was developed based upon the weather normalized billing determinants and costs for each of the rate schedules for the COSS test period as defined above. The revenues received by each rate class were calculated (or target balanced) such that the resulting Rate of Return ("ROR") for each rate class equals the Company's proposed overall ROR. Schedule SS-E5 R-1 contains the complete details of these final COSS model results, Schedule SS-E6 R-1 presents a summary report of the revenue requirements by functional segment, while

Schedule SS-E7 R-1 shows the revenue requirements by function (or segment) for each rate class.

The detailed description of how all COSS items are modeled, segmented, and functionalized is discussed in Appendix-E1. In Appendix-E1, a description is provided of how each of the major plant categories (gross plant) is segmented or functionalized. I then discuss the procedures used for Common and General plant, depreciation reserve, adjustments to rate base, operating revenues, O&M expenses for utility plant, A&G expenses, depreciation and amortization expenses, pro forma expense adjustments, and finally, taxes.

Schedule SS-E5 R-1 shows the details of the COSS used to calculate distribution revenue requirements by rate schedule. This study was used in the development of the proposed rates. These results are summarized by revenue requirements for each rate schedule and by segment in Schedule SS-E6 R-1.

Q. Please summarize the results of the Company COSS.

A. Schedule SS-E5 R-1 shows the details of how each plant and expense item was separated into each of the six segments and allocated to each category of customers for each of the various rate classifications based upon the extent to which those groups of customers caused the costs, along with the results of the allocation for each plant and expense item. Schedule SS-E6 R-1 shows a high-level summary of expenses, plant, and revenue requirements for each of the six functional segments, while Schedule SS-E7 R-1 is a summary report of the rate related revenue requirement for each rate class in total.

The revenue requirements reported in Schedules SS-E5 R-1, SS-E6 R-1 and SS-E7 R-1 do not include the costs or revenue requirements associated with adjustment clauses and New Jersey Sales and Use Tax ("SUT"). These costs, however, will be collected from customers directly through the appropriate charges, as I will discuss in the Rate Design portion of this testimony.

Synchronizing the Cost of Service Study to the Rate Design

Q. Please explain how the Company COSS was synchronized with the proposed rate design.

A. As previously noted, the Company COSS is based on the period of January 1, 2022 through December 31, 2022, while the rate design is based on the Test Year of June 1, 2023 through May 31, 2024. It is not possible to use the COSS results directly in the rate design process because the number of customers, kilowatt-hours delivered, as well as plant and expenses are slightly different between these two time periods. To properly execute the rate design process, the Company COSS results must be adjusted slightly to correspond to the rate design test year period. The methodology used to synchronize the COSS results is included in Schedule SS-E8 R-1. Because the primary difference is in the number of customers and amount of energy delivered, each functional segment's revenue requirement from Schedule SS-E7 R-1 was multiplied by the ratio of either the number of customers or kilowatt-hours delivered for the rate design test year to the value during the COSS year. The development of these sync factors is shown on page 1 of Schedule SS-E8 R-1. The revenue requirements associated with the Street Lighting Segment (Col 1), Local Delivery Segment (Col 3), and the System Delivery Segment (Col 4) were adjusted by the ratio of the kWh delivered in these two periods. The revenue requirements associated with the Access Segment (Col 2), Customer Service Segment (Col 5) and the Measurement Segment (Col 6) were adjusted by the ratio of the number of customers in these two periods, except for rate classes BPL, BPL-POF, and PSAL, which were adjusted by the kWh sync factor described above for all functional segments. These steps are shown on lines 1 to 15 of page 2 of Schedule SS-E8 R-1. The resulting adjusted COSS functionalized revenue requirements are each then adjusted on an equal percentage basis so that the total equals the proposed revenue requirements, as set forth on lines 21 to 35 of page 2 of Schedule SS-E8 R-1. It is these final adjusted functionalized revenue requirements that are used in the rate design process.

RATE DESIGN

Introduction

Q. What are your objectives for developing proposed electric rates?

A. The proposed electric rates have been developed to meet several objectives. The primary purpose is to provide recovery of revenues equal to the amount of the proposed revenue requirement. Additionally, this recovery should be effectuated on an equitable basis that provides correct price signals to individual customers based on the cost to serve those customers. The final objective is that rates should be simple and understandable for the customer.

Q. Why is it important to send correct price signals to individual customers based upon the cost to serve those customers?

A. I cannot overemphasize the need for development and implementation of correct price signals to customers. Distribution pricing must follow the underlying demand-based cost causation. Rates designed following this methodology will be equitable and will provide the ability for appropriate demand response from customers who are able to change usage patterns to achieve economic savings as a result of the price signals provided.

Q. What determines the cost to serve customers?

A. The Company COSS presents an allocation among customer groups of the embedded costs to provide regulated utility services and determines the cost to serve customers.

Q. Are the proposed new rates based solely on the results of the Company COSS?

A. No. The COSS is a guide to appropriate ratemaking; its results are not applied in a strict mathematical manner to design proposed rates. While the goal is to move rates toward a full cost basis, the achievement of that goal must be balanced against the need to achieve reasonable end results as I discuss more fully below.

Q. Do the rates included in your testimony include or exclude New Jersey SUT?

A. The proposed rates discussed in the next sections of my testimony and associated Schedules exclude SUT unless specifically indicated. However, the appropriate prices both without and with SUT are included in the Proof of Revenue by Rate Schedule in Schedule SS-E11 R-1 as well as the proposed Tariff Sheets set forth in Schedule 1 of the transmittal letter, and all other schedules that reference rates charged to customers.

<u>**Limitations on Rate Changes**</u>

Q. Did you apply limits in designing proposed rates in this proceeding, and, if so, why?

A. Yes. To achieve an overall goal of designing just and reasonable rates, I applied the principle of "gradualism" to temper the rate increases indicated by the results of the Company COSS. To apply the principle of gradualism, I employed a number of limits on the size of the rate increases that are proposed.

Q. Please describe the rate increase limits used in developing the proposed electric rates.

A. The first limit is that the proposed overall percentage revenue increase will be shared among all customer classes. Although a primary goal is to move the distribution rates for each rate class toward costs as indicated by the Company COSS, no class will receive less than 50%, nor more than 125% of the overall average distribution percentage increase. In addition, no class will receive more than 150% of the overall average percentage bill increase. These rate increase limits were selected to provide a reasonable balance between the goal of moving towards costs, and the need to achieve equity among customers. The calculation and percentage values of these limits are shown on page 1 of Schedule SS-E9 R-1.

Q. Are there any exceptions to the proposed limits?

A. Yes. Much of the revenue requirement increase has been driven by grid investments that are unrelated to BPL and PSAL luminaries and poles. BPL luminaires and poles current distribution revenue is nearly at its cost to serve, therefore the proposed minimum distribution revenue percentage increase was lowered from 19.742% to 10 PSAL luminaires and poles current distribution is higher than its cost to serve, so its BPL luminaires and poles current distribution revenue is nearly at its cost to serve, therefore proposed minimum distribution revenue percentage increase was also lowered 10%. is 20.607%, which increases its revenue almost equal to its cost to serve.

<u>**Inter Class Revenue Increase Allocations**</u>

Q. Please describe the process for allocating the proposed distribution increase to each rate class.

A. Page 1 of Schedule SS-E9 R-1 shows the calculation of the overall average percentage increase for distribution and total electric bills, as well as the calculation of the upper and lower limits to be used in the inter class revenue increase allocation on Schedule SS-E9 R-1, page 2.

Page 2 of Schedule SS-E9 R-1 shows the proposed inter-class allocation of the revenue increase. The Rate Schedules are indicated in Column 1, while Column 2 is the Proposed Distribution Revenue Requirement based upon the Company COSS results that were synchronized to the rate design test year. Column 3 is the Present Distribution Revenue, while Column 4 shows the increase that would occur if the synchronized Company COSS results were used directly – hence the use of the word "Unlimited" in the column heading. Column 5 is the present total electric bill calculated as if all customers were supplied at BGS rates. Column 6 is the percentage increase in distribution if the unlimited increase in dollars (from Column 4) were applied to the rates; that is, the percentage increase to each rate schedule if these COSS based increases were applied without constraints. The result of the proposed allocation of the Company's revenue requirement increase to the rate classes, consistent with the principles outlined in the previous section, Limitations on Rate Changes, is presented in Column 7 and Column 9. Specifically, Column 7 shows the percentage increase and Column 9 shows the Proposed Distribution Revenue Increase by Rate Class. Column 8 shows the proposed total bill percentage increase if all customers were supplied at BGS rates.

The final step was to calculate the proposed distribution revenue increases for all rates other than Rate Schedules BPL and PSAL. These calculations and the application of the limits were performed in an Excel spreadsheet utilizing the "Goal Seek" function to both meet all of the requirements of the limits and properly allocate any revenue shortfall between the rates, while recovering the full requested increase in distribution revenue.

Page 3 of Schedule SS-E9 R-1 continues the proposed inter-class allocation from page 2. Column 2 carries over the Proposed Distribution Revenue Increase from Column 9 of page 2 and adds on the revenue impacts of TAC (from Column 3) and the proposed DAC (from Column 4). Column 5 shows the resulting net distribution revenue increase including TAC and DAC, while Column 6 shows the proposed total bill percentage increase if all customers were supplied at BGS rates.

Q. How should the rate design be affected if the Board approves an amount other than the Company's overall revenue increase request?

A. If the Board approves an amount other than the Company's overall revenue increase request, the increase to each of the classes should be allocated in proportion to the proposed distribution revenue increase shown in Column 9 of Schedule SS-E9 R-1, page 2.

<u>General Rate Design Principles and Methodology</u>

Q. Please describe the general rate design principles and methodology used in developing the proposed electric rates.

A. The rate design methodology presented in this testimony follows the philosophy of the cost allocation methodology used in the Company COSS in order to align, as closely as practicable, the rates (prices charged to customers) with the underlying costs of serving those customers. This is a key element in the Company's rate design and its importance cannot be overstated. The rate design process is not just to recover the proper amount of revenue from each class, but, to the extent practicable, from individual customers as well, thereby preventing the subsidization of one customer by another. An appropriate rate design will provide correct price signals that reflect how customers' individual facilities impact the costs of the electric distribution system. Only by giving due recognition to what it costs to serve customers can the customers make the correct economic decisions.

The Service Charges for all rates that have service charges were set to move towards the sum of the revenue requirements indicated in the Company COSS for the Customer Service, Measurement and Access segments. With the exception of Rate Schedule RS and RHS, the change in these Service Charges were limited to the same general inter rate class limits of no more than 150% of the overall average distribution percentage increase. The proposed Service Charge change for Rate Schedules RS and RHS will be discussed later in my testimony.

These limits were selected to provide a reasonable balance between the goal of moving each rate component toward costs, and the goal of avoiding unreasonable bill impacts. Any shortfall in Service Charge revenue resulting from these limits was transferred to the remaining Local Delivery based charges of the particular rate schedule. These calculations are as shown in Schedule SS-E10 R-1.

The Distribution Charges for each rate class were set, subject to the limits on the percentage change previously discussed, to recover all the revenue requirements of the Local and System Delivery segments plus any shortfall created from limitations on the proposed Service Charges. The specific unit rate charges (the per kWh or per kW charge) in each rate class are designed to recover the revenue requirements of the Local Delivery segment from annual billing determinants, while the revenue requirements for System Delivery are designed to be recovered only through summer billing determinants. Because the Company's system peak has consistently occurred during the summer period, the summer kWh is the best billing determinant to send the price signal to the customer that is most closely aligned with cost causation. For example, for a rate designed only around non-blocked kWh charges, such as Rate Schedule HS, the winter charge per kWh is the Local Delivery segment revenue requirement divided by the annual kWh use (the annual billing determinant). The summer charge per kWh is the System Delivery segment revenue requirement divided by the summer kWh use (the summer billing determinant), plus the Local Delivery segment revenue requirement divided by the annual kWh use (the annual billing determinant).

For the demand Rate Schedules GLP, LPL and HTS, the Company is proposing to continue two separate demand charges as currently applied. The first, the Annual Demand Charge, is a charge per kW for the monthly maximum kW that will be applicable in every month and is based on each rate class's portion of the Local Delivery segment costs divided by the sum of the customers' monthly peak demands. For Rate Schedule GLP, these applicable demands are the customer's monthly measured peak demands over the entire year. For Rate Schedule LPL-Secondary ("LPL-S") and LPL-Primary ("LPL-P"), these applicable demands are the customer's monthly measured peak demands occurring during any time period over the entire year. For Rate Schedule HTS-Subtransmission ("HTS-S") and HTS-High Voltage ("HTS-HV"), the applicable demands are the customers' single highest demand that occurs at any time during the entire year, also referred to as a "ratcheted demand."

The second demand charge, the Summer Demand Charge, is a charge per kW of the monthly peak demand but is only applicable in the four summer billing months – June through September. This charge is based on each rate schedule's share of the System Delivery segment cost divided by the appropriate kW peak demands for the summer period only. For Rate Schedule GLP, these applicable demands are the customers' monthly peak demands for the summer billing months only (June to September billing months). For Rate Schedules LPL-S, LPL-P, and HTS-S, these applicable demands are the customers' monthly peak demands occurring during the on-peak periods in the four summer billing months.

The recovery of distribution revenue requirements through demand charges for those rate classes that are assessed demand charges is consistent with the Company's historical and current rate structure. Put into the context of the total electric bill for the average customer based upon annualized weather normalized rates, the portion of revenue that is collected through distribution demand charges remains small and ranges from approximately 17% for Rate Schedule GLP to 5% for Rate Schedule HTS-HV.

The limits for the changes in charges for individual luminaires and poles under Rate Schedules BPL, BPL-POF and PSAL will be discussed later in the discussion on the specific changes made to these Rate Schedules.

<u>RATE SCHEDULE SPECIFIC CHANGES</u>

<u>Rate Schedule Residential Service ("RS")</u>

Q. Please describe the rate design for Rate Schedule RS.

A. The rate design for Rate Schedule RS is shown starting on page 4 of Schedule SS-E11 R-1. The current rate is comprised of a monthly Service Charge, plus distribution charges based on monthly kWh use, with the charges differentiated using a two-block rate structure in the summer period.

As indicated in Schedule SS-E10 R-1 - Service Charge Calculations, (line 2), the Company COSS indicates that a significant increase in the monthly Service Charge is warranted. Consistent with the principle of cost causation, balanced by the principle of gradualism, the Company proposes that the Service Charge be increased by 1.5 times the average distribution increase to move the service charge closer to actual cost. The present kWh charges are blocked at 600 kWh per month. The winter rates are identical for both blocks, whereas the summer rates have an inclining block rate, where the second block (for usage greater than 600 kWh per month) is $0.003821 per kWh greater than the rate for the first block.

As previously described, the Company COSS results indicate that the summer charges should be greater than the winter charges because System Delivery revenue requirements should be recovered through summer kWh charges and Local Delivery revenue requirements should be recovered over the entire year. In the Company's previous base rate case, the summer kWh charges were set at an inclining block rate structure whereby the second block was $0.003821 per kWh (without SUT) higher than the first block. There is no underlying cost basis for an inclining block rate structure for the recovery of distribution costs. In fact, analysis based on load profile data shows that higher use customers have a higher load factor which would support a lower per kWh charge for the second block or a "declining block" rate structure. Despite the evidence that supports a declining block rate structure, consistent with the principle of gradualism, the Company proposes to keep the first and second blocks the same and not request a declining block rate structure.

Even with the proposed revenue increase, the proposed RS rate class revenue is significantly below cost. In addition, the current Summer Distribution kWh Charge is significantly lower than the cost to serve while the Winter Distribution kWh Charge is somewhat higher than the cost to serve. The proposed revenue increase less the proposed Service Charge increase will be added proportionately to the current system and local delivery costs. Therefore, the Company is proposing to limit the amount of the scaled system delivery costs to collected in the summer to 60% via the Summer Distribution kWh Charge and the remaining 40% of the system delivery costs collected with the local delivery costs equally over both Summer and Winter Distribution kWh Charges. As a result, the remaining distribution revenue increase for RS from page 2 of Schedule SS-E9 R-1, less the Service Charge revenue increase, will be recovered as described above through both the Summer and Winter Distribution kWh Charges.

The results of the Rate Schedule RS rate design appear on page 5 of the Proof of Revenue in Schedule SS-E11 R-1. The general format of the calculations is described on the first page of that Schedule. The calculation of the annual electric supply cost utilized in the Proof of Revenue for this and all other rate schedules is based upon all customers purchasing electricity on the appropriate BGS service. The magnitude of the BGS values remain constant in both sides in the Proof of Revenue (Schedule SS-E11 R-1) and their inclusion allows the proposed rate changes to be viewed in the context of a customer's overall bill.

Typical Rate Schedule RS customer bill impacts resulting from these changes are shown on pages 1-3 of Schedule SS-E12 R-1.

<u>Rate Schedule Residential Heating Service ("RHS")</u>

Q. Please describe the rate design for Rate Schedule RHS.

A. The rate design for Rate Schedule RHS is shown starting on page 6 of Schedule SS-E11 R-1. In general, the structure of Distribution Charges for customers on RHS remains the same as it is currently. The rate is comprised of a monthly Service Charge, plus distribution charges based on monthly kWh use, with the charges continuing to be differentiated using a two-block configuration in the summer and winter periods. This Rate Schedule remains closed, grandfathered to specific customers as it has been since January 1993.

As indicated on Schedule SS-E10 R-1 Service Charge Calculations, (line 3), the direct use of the Company COSS revenue requirements would indicate that a significant increase in the monthly Service Charge is warranted. In the past, the Service Charge for Rate Schedule RHS has been set equal to the Service Charge for Rate Schedule RS. Consistent with the principle of cost causation, the Company proposes to maintain this relationship such that the Service Charge would be increased by an amount equal to the treatment proposed in the Rate Schedule RS Service Class

The kilowatt-hour charges are presently blocked at 600 kWh per month, with a declining rate structure block in the winter and an inclining block rate structure in the summer. The Proposed Distribution Revenue for RHS from page 2 of Schedule SS-E9 R-1 less the Service Charge revenue was designed to be recovered through the Distribution kWh charges. This remaining balance of revenue requirement was apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS. The Local Delivery portion of the remaining balance of revenue was divided by the sum of the total annual kWh for all usage. The proposed Winter Distribution Charges were designed to maintain the current declining block differential of ($0.017600). The Summer

Distribution Charges were designed to recover both the System Delivery portion of the remaining balance of revenue and the summer portion of the Local Delivery revenue. The Company is proposing to set identical rates for both summer blocks, thus eliminating the inclining block rate structure. As is the case with the RS rate class, there is no underlying cost basis for an inclining block rate structure for the recovery of summer distribution costs. In fact, an analysis based on load profile data shows that higher use customers also have a higher load factor based on their individual customer peaks, which would support a declining block rate structure for higher use customers. Consistent with the principle of gradualism, the Company proposes to keep the first and second blocks the same.

Typical Rate Schedule RHS customer bill impacts as a result of these changes are shown on page 4 of Schedule SS-E12 R-1.

<u>Rate Schedule Residential Load Management Service (“RLM”)</u>

Q. Please describe the rate design for Rate Schedule RLM.

A. The Company is proposing to close Rate Schedule RLM to new customers when the proposed Residential TOU Pilot Program becomes available to customers. The current rate design for the Rate Schedule RLM is shown starting on page 8 of Schedule SS-E11 R-1. The structure of distribution charges for customers on Rate Schedule RLM remains similar to what it is currently. The rate is comprised of a monthly Service Charge, plus time differentiated charges based solely on total monthly kWh use in each of two time periods. The Company COSS indicated that a small decrease in the Service Charge was warranted for this Rate Schedule. Applying the limits I discussed previously, the Company is proposing to maintain the current Service Charge.

The Proposed Distribution Revenue for Rate Schedule RLM from page 2 of Schedule SS-E9 R-1 less the Service Charge revenue was designed to be recovered through the

Distribution kWh charges. This remaining balance was apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS. The Local Delivery portion of the remaining balance was divided by the sum of the total annual kWh for all usage. The System Delivery portion is proposed to be recovered during the Summer On-Peak period only, consistent with the methodology detailed earlier.

Typical Rate Schedule RLM customer bill impacts as a result of these changes are shown on page 6 of Schedule SS-E12 R-1.

Rate Schedule Water Heating Service ("WH")

Q. Please describe the rate design for Rate Schedule WH.

A. The rate design for Rate Schedule WH is shown starting on page 10 of Schedule SS-E11 R-1. This Rate Schedule also remains closed and is grandfathered to specific premises, as it has been since October 1980.

There currently is no Service Charge for service under this rate schedule and none is proposed. The unit charge has been set equal to the Proposed Distribution Revenue for Rate Schedule WH from page 2 of Schedule SS-E9 R-1 divided by the total billed kWh.

Rate Schedule Water Heating Storage Service ("WHS")

Q. Please describe the rate design for Rate Schedule WHS.

A. The rate design for Rate Schedule WHS is shown starting on page 12 of Schedule SS-E11 R-1. The Company is proposing no change in the structure of Distribution Charges for this Rate Schedule. The rate comprises a monthly Service Charge plus non-differentiated distribution charges based solely on monthly kWh use.

As indicated in Schedule SS-E10 R-1 Service Charge Calculations, (line 6), the Company COSS indicates that a significant increase in the monthly Service Charge is warranted. The Company, however, proposes that the Service Charge should only be increased consistent with the limits discussed previously. The charge was not moved closer to actual costs in order to minimize the percentage increase in the total bill for customers with very small usage.

The Proposed Distribution Revenue for Rate Schedule WHS from page 2 of Schedule SS-E9 R-1, less the Service Charge revenue, was designed to be recovered through the Distribution kWh charges.

Rate Schedule Building Heating Service ("HS")

Q. Please describe the rate design for Rate Schedule HS.

A. The rate design for Rate Schedule HS is shown starting on page 14 of Schedule SS-E11 R-1. This Rate Schedule is presently closed and is grandfathered to premises receiving service as of August 1, 2003.

As indicated in Schedule SS-E10 R-1 Service Charge Calculations, (line 7), the Company COSS indicates that an increase in the monthly Service Charge is warranted. The Company proposes however that the Service Charge should only be increased consistent with the limits previously discussed. The charge was not moved closer to actual costs in order to minimize the percentage increase in the total bill for customers with very small usage.

The summer/winter price differential follows the kWh-only rate price philosophy as previously discussed. The Proposed Distribution Revenue for Rate Schedule HS from page 2 of Schedule SS-E9 R-1, less the Service Charge revenue, was designed to be recovered through the Distribution kWh charges. This remaining balance was apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS. The Local Delivery portion of the remaining balance was divided by the sum of the total annual kWh for all usage. The System Delivery portion is recovered through the summer period Distribution kWh charges only.

<u>Rate Schedule General Lighting And Power Service ("GLP")</u>

Q. Please describe the rate design for Rate Schedule GLP.

A. The rate design for Rate Schedule GLP is shown starting on page 16 of Schedule SS-E11 R-1. The Service Charge has generally been set based on the per customer revenue requirements for the Access, Customer Service and Measurement segments and increased in accordance with the limits previously discussed. The Service Charge for unmetered accounts was set based on the per customer revenue requirements for the Access and Customer Service segments because this sub-class has no meters or meter reading expenses. The Service Charge for Rate Schedule GLP-Night Use was set equal to the standard GLP Service Charge. Previously, the GLP Night Use Service Charge was set equal to the Rate Schedule LPL-Secondary Service Charge because previous generation interval meters were required. With the implementation of the advanced metering infrastructure project, the standard GLP meter will be able to provide the interval data to bill the Night Use Provision. These calculations are shown on lines 11-14 of Schedule SS-E10 R-1.

The proposed Distribution Revenues for Rate Schedule GLP from page 2 of Schedule SS-E9 R-1, less the Service Charge revenue, are designed to be recovered through the Distribution kW and kWh Charges. The current relationship in the recovery of Distribution costs between kW and kWh charges is being maintained in the proposed rate design. The amount allocated to be recovered through kWh charges was apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS.

The amount allocated to be recovered through kW charges was apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS. The Annual Peak Demand charge was calculated as the Local Delivery segment costs divided by the sum of the Rate Schedule GLP customers' billed Monthly Peak Demands.

The second demand charge, termed the Summer Demand Charge, is calculated as the System Delivery segment cost divided by the sum of the Rate Schedule GLP customers' billed Monthly Peak Demands for the four summer months, June through September.

The Company proposes to retain the provision for unmetered Police, Recall or Fire Alarm Service with all charges increased at the average Rate Schedule GLP distribution percentage increase.

Typical Rate Schedule GLP customer bill impacts as a result of these changes are shown on pages 8 and 9 of Schedule SS-E12 R-1.

Q. What other changes are you proposing to Rate Schedule GLP?

A. To correct an issue from the rate design approved in the 2018 Rate Case Order, the Company proposes to adjust the current GLP rates to rates that would have been in place as intended in 2018. From this new baseline, the proposed rate adjustments based on proposed revenue requirements can be calculated. The prior rate design inverted the intended distribution kWh Summer and Winter rates, and the implemented kWh Winter rate was lower than intended.

<u>Rate Schedule Large Power And Lighting Service ("LPL")</u>

Q. Please describe the rate design for Rate Schedule LPL.

A. The rate designs for Rate Schedules LPL-Secondary and LPL-Primary are shown starting on pages 20 and 24, respectively, of Schedule SS-E11 R-1.

The Service Charge has been set based on the per customer revenue requirements for the Access, Customer Service and Measurement segments and is shown in Schedule SS-E10 R-1 and increased in accordance with the limits previously discussed.

The Company proposes to continue the current provision that provides a reduced Service Charge for the closed provision for grandfathered LPL-Primary customers expected to have a peak demand of less than 100 kW. The Service Charge for this sub-class has been set based on the sum of the per customer revenue requirements for the Rate Schedule GLP Access segment, Rate Schedule GLP Customer Service segment, and the Rate Schedule LPL-Primary Measurement segment, subject to the limits I discussed earlier.

The Proposed Distribution Revenues from LPL-Secondary and LPL-Primary service as set forth on page 2 of Schedule SS-E9 R-1, less the applicable Service Charge revenues, were designed to be recovered through the Distribution kilowatt charges. These remaining balances were apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS.

The Annual Peak Demand charge was calculated equal to the Local Delivery segment costs from the Company COSS divided by the sum of the LPL customers' billed Monthly Peak Demands that occur at any time during each month.

The second demand charge, termed the Summer Demand Charge, is calculated by dividing the System Delivery segment cost by the appropriate sum of the On-Peak Monthly Peak Demands for the four summer months, June through September.

Typical Rate Schedule LPL customer bill impacts as a result of these changes are shown on pages 12 and 14 of Schedule SS-E12 R-1.

Rate Schedule High Tension Service ("HTS")

Q. Please describe the proposed rate design for Rate Schedule HTS.

A. The rate design for Rate Schedules HTS-Subtransmission and HTS- High Voltage are shown starting on pages 28 and 32, respectively, of Schedule SS-E11 R-1.

The Service Charges and kW demand charges have been calculated and are proposed to apply on a similar basis for Rate HTS-Subtransmission and Rate HTS-High Voltage and Rate Schedule LPL. The only slight difference is that because customers on Rate Schedule HTS-High Voltage are served directly from transmission facilities, there are no System Delivery revenue requirements, and thus there is no Summer Demand Charge necessary for Rate Schedule HTS.

Typical Rate Schedule HTS-S customer bill impacts as a result of these changes are shown on page 16 of Schedule SS-E12 R-1.

Payment Schedule Purchased Electric Power ("PEP")

Q. Is the Company proposing a change to Payment Schedule PEP?

A. The Company is proposing no changes to the Payment Schedule PEP.

ELECTRIC VEHICLE ("EV") COST OF SERVICE STUDIES ("COSS")

Residential Study

Q. Please describe how the Residential EV COSS was developed.

A. The residential electric vehicle ("Res-EV") COSS was developed using 12 months of electric vehicle charger data from August 1, 2022 through July 31, 2023. This period was utilized in place of the 2022 calendar year cost of service test year as the data was readily available and allowed for the largest sample size of customers with a full year of charging data.

The data was collected in 15-minute increments with each increment consisting of total kWh usage, average kW demand, and peak kW demand. Each increment was summed to hourly data, by customer and date. The final data set included data from 826 residential EV charging customers.

From this set of data, the sum of the individual customer peaks was totaled, as well as the coincident peak usage that occurred during the Company system peak that occurred Tuesday, August 9, 2022 from 4-5pm. Sum of peak data was used to determine the EV customer contribution to Local Delivery costs and Coincident Peak data was used to determine the respective contribution to System Delivery Costs. From here, ratios were calculated to the total RS rate class Local Delivery and System Delivery functions.

Q. What were the results of the study?

A. Based on COSS results, the RS Local Delivery costs are equal to $481,937,668 with a Res-EV Sum of Peaks ratio of 16,651 kW / 11,830,661 kW = 0.1407% or $678,295. Similarly, the total RS System Delivery costs are equal to $308,233,692 with a Res-EV Coincident Peak ratio of 34 kW / 4,362,852 kW = 0.0008% or $2,404 for a total Res-EV Local and System Delivery revenue requirement of $664,204. Over the year of usage, total Res-EV energy usage equaled 2,921,627 kWh, resulting in a COS energy rate of $0.227341per kWh, which is significantly above the proposed class average RS Rate Schedules Distribution kWh rate of approximately $0.058523 per kWh.

Q. Based on these results, are you proposing alternative rates for Residential EV charging?

A. Yes. As part of the proceeding, the Company is proposing a Residential TOU Program, which will offer off-peak rates that are significantly lower than current RS or RLM off-peak rates. Details on this Program are described further below in my testimony.

Commercial & Industrial ("C&I") EV COSS

Q. Please describe how the C&I EV COSS was developed.

A. The C&I EV COSS was performed in a similar matter to the Residential EV COSS, with the only exception being the date range and source of the data. C&I data consisted of data from July 1, 2022 through June 30, 2023 from 34 DCFC customers.

Based on COSS results, the LPL-S Local Delivery costs are equal to $105,678,423 with an DCFC-EV Sum of Peaks ratio of 17,678 kW / 2,893,512 kW = 0.6110% or $645,660. Similarly, the total LPL-S System Delivery costs are equal to $129,958,748 with a DCFC Coincident Peak ratio of 6,187 kW / 1,946,767 kW = 0.3178% or $413,018 for a total DCFC Local and System Delivery revenue requirement of $1,058,678. Over the year of usage, total DCFC kWh equaled 30,361,295 kWh resulting in an effective COS energy rate of 0.034869 per kWh.

Q. Based upon the C&I COSS for DCFC customers, what does the Company propose?

A. The current rate structure for LPL-S is highly correlated to cost causation and is the ideal rate for all customers this size. However, to support the state's goal of promoting EV adoption and to ease cost burdens on DCFC customers during this early phase of market introduction of DCFC facilities, the Company is proposing a Distribution kWh charge to replace its Distribution Summer and Annual Demand kW charges for customer premises that only serve as DCFC facilities. Details of the proposed rate can be found on page - 58 - later in my testimony.

PROPOSED RESIDENTIAL TOU RATES

Overview

Q. Do you propose to include a Residential TOU Rates in PSE&G's tariff for electric service?

A. Yes. The Company will offer two new Residential TOU rates as described by Company witness Ahmad Faruqui, Principal Emeritus with The Brattle Group. The proposed tariff provision is consistent with the mechanism described by Mr. Faruqui and can be found in Figure 4 Summary of Current and Proposed RS Rate on page 13 of Exhibit P-10.

Q. Did you assist Mr. Faruqui in developing the proposed rates?

A. Yes. Mr. Faruqui and I worked closely in developing the proposed residential TOU rates which are discussed in more detail below.

Q. As part of the RS-TOU rates, are there any proposed changes to existing rate schedules?

A. The RS-TOU rates have been developed in a manner that provides for the closing of the RLM Rate Schedule to new customers once the RS-TOU is made available.

Q. Is it reasonable for the Board to consider approval of the proposed RS-TOU rates and corresponding rate design that you are proposing in this proceeding?

A. Yes. It is reasonable for the Board to consider the approval of the Proposed RS-TOU and corresponding rate design. The proposed RS-TOU rates align with cost causation, using cost-based rates developed by a COSS and rate design, as the Company is proposing in this filing, and sends the correct economic signals to customers, allowing them to make accurate economic decisions regarding their electricity usage and, as result, helps reduce future investment requirements and thus reduces future rates for all other customers. Adoption of the proposed RS-TOU rates will serve to encourage the most efficient use of electricity possible at a fair and equitable cost. Cost based rates provide a more fair and equitable allocation of costs across customers, support the correct economic customer decision making process regarding energy usage and related investments, and help keep rates more affordable.

<u>Rate Design Detail</u>

Q. What is the Company's proposal for new TOU rates?

A. The Company proposes two new voluntary residential TOU rates: a Two Period TOU Rate ("RS-TOU 2P") and a Three Period TOU Rate ("RS-TOU 3P").

The RS-TOU 2P has two periods, on-peak from 4pm to 9pm weekdays excluding PJM Holidays and off-peak all other hours.

The RS-TOU 3P rate has three periods, on-peak from 4pm to 9pm weekdays excluding PJM Holidays (same as RS-TOU 2P), off-peak from 12am to 6am and mid-peak for all other times.

Q. What are the objectives used to design these TOU rates?

A. The first objective of the TOU rates is to create rates that would provide customers with time of use pricing options that give customers options to move some of their discretionary, relative to timing, usage to non-peak times, where lower pricing could be offered reflecting the lower costs to serve during off peak times. These time-dependent price options may be of interest to those customers for whom the off-peak pricing meets their usage patterns or for those customers willing to modify their usage pattern to take advantage of the lower non-peak rates.

Q. What is the overall rate design philosophy for the proposed RS-TOU rates?

A. As described in the testimony of Mr. Faruqui, the overall rate design philosophy is to design the TOU rates to be revenue neutral to the aggregate RS Rate Schedule. This implies that the goal is that if the entire RS Rate Schedule would be served on either the RS-TOU 2P or 3P rate with no change is usage, the revenue collected from all customers would be the same.

Q. Can you describe the components of the proposed RS-TOU rates and how they were developed

A. Below is description of each rate component and the basis of how they were developed.

1. **Service Charge**: With the implementation of AMI meters, there is no difference in metering cost from a customer on the RS Rate Schedule. Therefore, the proposed service charge for both the RS-TOU 2P and RS-TOU 3P rates will be identical the RS Rate Schedule service charge.

2. **Distribution Energy kWh Charges**: System Delivery Distribution costs are allocated to customers based upon the customers contribution to Coincident Peak Demand. Since PSE&G uses energy (kWh) charges instead of demand or obligation charges to recover this cost, the closest rate to collect these costs would be the Summer on-peak kWh charge. However, this would result in a very high summer on-peak kWh charge. To mitigate the difference between the summer and winter charge and still have the price signal aligned with cost causation, the System Delivery component was allocated 1.5 times more to the Summer on-peak vs. the on-peak winter period. Then an adjustment factor was used to ensure that the System Delivery Costs in the proposed RS-TOU rates are equal to the System Delivery costs embedded in the proposed RS Distribution kWh rates.

   Local Delivery Distribution costs are allocated to rate schedules by the sum of customers' individual peaks in the rate class. Since individual customer peaks can happen at any time and consistent with the current RS Rate Schedules rate design, the Company proposes to recovery this cost over all energy usage. However, to still send the proper price signals to customers and to minimize the mid and off-peak rates, these costs were also ratioed between time periods. For the RS-TOU 3P rate, the on and mid-peak rates were designed to be two times the off-peak rate. To keep the on-peak rates the same between the 2P and 3P rates, the on-peak contribution of Local Delivery costs designed for the 3P rates was used for the RS-TOU 2P rate with the balance of Local Delivery cost recovered in the longer RS-TOU 2P off-peak period. Then an adjustment factor was used to ensure that the Local Delivery Costs in the proposed RS-TOU rates are equal to the System Delivery costs embedded in the proposed RS Distribution kWh rates.

The proposed RS-TOU Distribution kWh rates without and with SUT are shown below in Table 1.

9n3		$/kWh - w/o SUT		9n3		$/kWh - w/ SUT	
Rate	Period	Summer	Winter	Rate	Period	Summer	Winter
Distribution	on peak	0.194959	0.143019	Distribution	on peak	0.207875	0.152494
3P	mid peak	0.039137	0.039137	3P	mid peak	0.041730	0.041730
	off-peak	0.019568	0.019568		off-peak	0.020864	0.020864
Distribtuion	on peak	0.194959	0.143019	Distribtuion	on peak	0.207875	0.152494
2P	off peak	0.034330	0.034330	2P	off peak	0.036604	0.036604

Table 1

The calculation for these distribution rates can be found in workpaper WP-SS-TOU.xlsx.

3. **Supply Charges:** Since Supply rates are determined in BGS proceedings, I developed estimated Transmission and Generation rates, which are revenue neutral to RS rates, to calculate total bill impacts for these proposed rates. The development of the supply rates can also be found in workpaper WP-SS-TOU.xlsx. The Company intends to propose corresponding generation and transmission RS-TOU rates in future BGS proceedings.

Program Details

Q. Which customers could utilize the proposed RS-TOU rates?

A. Any residential customer could choose to be served under this proposed rate.

Q. Would customers be defaulted to RS-TOU rates?

A. No. These rates will be entirely voluntary opt-in options, with no customers defaulted into or required to move to these rates.

Q. Would customers be able to move back to the RS Rate Schedule?

A. The Company proposes that for each residential customer that opts into one of the two new RS-TOU rates, at the end of the initial 12 month period, the Company will provide each customer with reporting showing his or her 12 month bill on the new RS-TOU rate and what this 12 month bill would have been on the RS Rate Schedule. The customer will be offered a one-time refund of the difference if the 12 month bill on the RS-TOU rate was higher compared to the RS Rate Schedule. This initial 12 month look back provision is incorporated to encourage customers to be more willing to try the RS-TOU rates knowing they will not be financially disadvantaged, and after the initial 12 month period, customers can chose to revert back to the RS Rate Schedule if they wish. The initial 12 month look back provision would only be available to customers who take service under either RS TOU rate during the first 24 months that the rate is available to customers.

Q. Is there any requirement to stay on the rate for any period of time?

A. There will be a requirement for customer to stay on the new RS-TOU rate for a period of 12 months. After being on the rate for a minimum of 12 months, customers would also be able to choose to switch back to the RS Rate Schedule at any time.

Q. What is the estimated implementation cost for these new T OU rates?

A. The new AMI meter system provides more detailed metering data that enables TOU rates and creates the ability to bill time of use rates in the Customer System. Once the proposed rates are approved as part of the rate case, new billing logic that meets stringent financial testing and SOX control standards will require an IT programming, testing and training effort. Also, the 12 month look back provision adds a layer of programming complexity as well. The initial estimate to be able to implement the proposed TOU rates is approximately $1.9 million.

Additionally, IT system changes are required to enable changes to a customer's rates without the need to change the customer's meter. This capability had previously been planned for a later phase of AMI use case deployment and is not currently not one of the 22 AMI Use Cases included in the CEF-EC program.[5] To support efficiency in administration of the proposed TOU rates, PSE&G recommends including these system changes in the CEF-EC program for deployment by the end of 2024, and requests the BPU's support for this approach.[6]

Q. What would be the time frame to be able to offer new RS TOU rates?

A. The project to implement the new RS-TOU Program would begin upon the effective date of this filing. It is currently estimated to take nine to twelve months after approval of the filing to make the RS-TOU Program available to customers.

Q. Is the Company proposing a customer communications plan for introducing the availability of the new RS-TOU Program and associate rate options?

A. In the several months before the RS-TOU rates become available, the Company will perform an initial awareness communications plan to all residential customers utilizing varied channels such as the web, bill messages, bill inserts, and digital advertisements at an estimated

[5] See testimony of Company witness Johnson regarding the 22 AMI Use Cases that are part of the CEF-EC program.
[6] This work can be managed within the existing CEF-EC program budget.

cost of $2.0 million. After the kickoff campaign, additional awareness campaigns would be done at regular intervals for the next two years at an estimated $500,000 per year. Additionally, there will be certain targeted communications to those customers identified as likely to be interested in the TOU rates, such as EV customers.

Q. What assumptions has the Company made regarding customer adoption of TOU rates?

A. The Company has proposed entirely voluntary adoption for residential TOU rates and not made any assumptions or targets for residential customer signups. It is assumed that the TOU rates will be of interest to price sensitive customers with usage that allows them to move that usage to off-peak periods. Some percentage of EV owners looking to save money would be likely adopters.

Q. Will there be increased expenses associated with the introduction and support of TOU rates?

A. Yes. Aside from the implementation and communication costs, there will be additional incremental costs related to supporting customers through these TOU options. While self-serve options such as an online rate analyzer will be available, it is anticipated that TOU options will drive increased calls from customers with questions. Additionally, the transitional items being offered, providing the 12 months bill comparison, possible refunds, and ability to change rates, will drive incremental calls and additional work in the billing department to support customers through this transition as customers get comfortable with TOU rates. In the initial three years of the TOU introduction, these incremental expenses are estimated to be in the range of $1.7 million to $3.3 million annually, including risk and contingency.

Q. Has the Company incorporated these RS-TOU rates into the calculated revenue requirement?

A. No. These rates have been designed to be revenue neutral with the proposed RS Rate Schedule, so there was no need for a change to the calculated revenue requirement based on the new TOU rates.

Q. How will the revenue collected under the RS-TOU 2P and RS-TOU 3P Rate Schedules be treated for the Conservation Incentive Program ("CIP")?

A. Since these TOU rates have been developed to be revenue neutral relative to the RS Rate Schedule, the Company is proposing to treat the new TOU Rate Schedule as customers served under the RS Rate Schedule. Therefore, the net distribution per customer will be based upon the RS Rate Schedule revenue per customer and the Company will have the same financial incentive to serve a residential customer either on the RS or RS-TOU rates.

Q. Can you please summarize all the estimated expected costs to implement the RS-TOU?

A. All of the estimated expected costs to implement Residential TOU for the first three years is estimated to total $12.4 million.

Q. How does the Company propose to recover the implementation costs associated with the new RS-TOU rates?

A. The Company proposes that the implementation costs be deferred with all the corresponding regulatory assets earning carrying charges at the Company's latest approved WACC. These costs and corresponding regulatory assets would be reviewed for prudency and cost recovery in the next base rate case.

Q. How does the Company propose to recover the customer support and customer communication and education expense costs associated with the new RS-TOU rates?

A. The Company proposes that the implementations costs be deferred and reviewed for prudency and recovery in the Company's next base rate case.

PROPOSED DCFC DISTRIBUTION KILOWATT-HOUR CHARGE

Q. Have you proposed a new Distribution kWh charge for customers who receive service solely as a DCFC facility serviced under the LPL-S Rate Schedules in lieu of the current annual and summer demand charges?

A. Yes.

Q. Can you please describe the charge?

A. As described in the C&I EV COSS section on page 49 earlier in my testimony, the kWh cost-based rate based upon the historic usage of 34 DCFC customers is $0.034869 per kWh without SUT. To develop a Distribution kWh rate that is comparable to the current Annual and Summer Demand Charge for the LPL-S Rate Schedule, the rate is adjusted for the ratio of the proposed LPL-S Annual and Summer Demand Revenue of $219,900,000 versus its cost to serve of $235,637,170 or 0.93321. As a result, the proposed DCFC Distribution kWh charge is $0.032540 per kWh without SUT ($0.034696 per kWh with SUT).

STREETLIGHTING CHANGES

LED Street Lighting

Q. Is the Company proposing changes to Streetlighting Rate Classes?

A. The Company proposes to no longer offer standard, non-LED streetlights in the BPL (Body Politic Lighting Service) and PSAL (Private Street and Area Lighting Service) Rate Schedules for new installations. The Company would continue to provide only maintenance and electric delivery service for existing non-LED luminaires that began taking service prior to the Board's approval of this proposal. The Company will not proactively replace functioning non-LED luminaires.

Q. Why is the Company proposing this?

A. This is being done to encourage the transition to energy efficient LED luminaires and the anticipated lack of availability and the cost of non-LED luminaires, upon approval by the Board.

Q. Other than the changes to the charges under the Street Lighting Rate Schedules, what other changes is the Company proposing as part of this filing?

A. The Company proposes that during any future maintenance activities on an existing non-LED Luminaire (bulb, photocell, or fixture failures), the Company may, at its sole discretion, replace a non-LED streetlight luminaire with an equivalent LED streetlight luminaire.

Q. What are the changes to the Streetlighting Tariff?

A. PSE&G proposes to close all non-LED Luminaires within the BPL and PSAL Rate Schedules and add new LED Luminaires.

Q. Are there energy efficiency and environmental benefits from the deployment of LED Luminaires?

A. Yes. LED luminaires are environmentally friendly as they reduce energy consumption and therefore carbon dioxide emissions. Also, LED luminaires are effective at managing light pollution.

Q. What are the implications with respect to the streetlight assets associated with the replacement of the non-LED luminaires with LED luminaires?

A. PSE&G's current streetlighting rate schedules provides that "Public Service has the right to replace obsolete luminaires, poles and all other associated equipment with equivalent equipment without the consent of its customers." PSE&G considers all non-LED luminaires that have an LED equivalent to be obsolete equipment and subject to replacement with an equivalent LED Luminaire, opportunistically when repairs or replacements are needed.

PSE&G proposes a change to the tariff to move all obsolete fixtures to the closed section of their respective tariffs.

Q. How will the change from non-LED luminaire to new LED luminaire fixture due to any type of failure (bulb/photocell/luminaire) in the normal course be handled from an accounting perspective?

A. The non-LED luminaire will be retired in the normal course of business.

Q. Will the company incur incremental costs by replacing existing non-LED luminaires failures with an LED luminaire?

A. While the Company manages its current non-LED inventory prudently and will try to minimize the amount inventory in anticipation of the changes discussed above, it is likely there would some amount of obsolete inventory that would result in an inventory write-off and associated incremental expense.

Q. How does the Company propose to recover these costs?

A. PSE&G proposes to defer these costs for recovery in the Company's next base rate case.

<u>Rate Schedule Body Politic Lighting Service ("BPL")</u>

Q. Please describe the rate design for Rate Schedule BPL.

A. As stated previously in my testimony, the Company is proposing to close the non-LED luminaires in the BPL Rate Schedule upon approval by the Board. Since the Company is proposing closed all non-LED luminaires and its present revenue is close to its cost to serve, , the Company proposes to limit the Distribution Charge utilizing the standard increase limits and to increase the Monthly Charges for poles and luminaires by an overall increase of 10% of revenue .

The results of the Rate Schedule BPL rate design are shown on page 37 of Schedule SS-E11 R-1. The general format of the calculations is described on the first page of that Schedule.

In accordance with the Stipulation approved by the BPU in Docket No. ET01120830, the Company offers four distinct service offerings of luminaires and poles under rate schedule BPL, each necessitating a unique set of prices, as follows:

- Specialty luminaires and poles having more than 50 units in service or new LED luminaires,
- LED luminaires and poles that are currently in the Tariff
- Current specialty luminaires and poles;
- Standard and luminaires and poles no longer available.

The first service offering is for LED luminaires and poles that are currently billed as specialty units and meet the 50-unit breakpoint discussed above or new LED luminaires that will take the place of equivalent non-LED units. These facilities are proposed to be offered as standard units whose price will be listed in the tariff. The units are referred to in the workpapers as “Tariff New.” Units already installed and being billed to customers will continue to be billed at the current customer specific charges already established. The individual tariff prices for these units are the greater of either the levelized annual revenue requirement of current costs calculated at Company’s proposed overall rate of return, or the highest price charged to an existing specialty customer.

The second service offering is for luminaires and poles that appear in the Rate Schedule BPL as Standard items and are referred in the workpapers as “Tariff Existing” Since we are proposing to close all non-LED luminaires, only the exiting tariff LED luminaries and poles are in this set. Unit prices for these facilities were first calculated for different luminaire or pole types based on the levelized annual revenue requirement of current costs calculated at the Company's proposed overall rate of return. Proposed changes in the individual Standard pole charges were limited to a range to ensure an aggregate increase 10% to all luminaire and pole revenue.

The third service offering is for current Specialty units, which are referred to in the workpapers as "Specialty." Units of this type already installed and being billed to customers will continue to be billed at the current customer specific charges. New Specialty units will be offered for installation after the conclusion of this proceeding and will follow the same customer specific formula as detailed in the Rate Schedule. The only change proposed for this service offering is an updated Maintenance Charge as set forth in the Rate Schedule.

The final type of offering is for current standard units that are no longer available for new installations. As previously discussed, this will include all non-LED luminaires such as Incandescent, Mercury Vapor, Metal Halide, High Pressure Sodium or Induction, units as well as some obsolete LED units. These are referred to in the workpapers (and in the Tariff) as "Tariff Closed" units.

For these proposed "Tariff Closed" standard non-LED luminaries, prices were adjusted to ensure that the total bill for the new LED equivalents would be equal to or lower than the proposed non-LED total bill. The remaining non-standard Tariff Closed items were adjusted to ensure that the overall luminaire and pole increase will be limited to a range to ensure an aggregate increase of 10% to all luminaire and pole revenue.

The final proposed individual LED luminaire and pole charges for "Tariff Existing" items were determined through iteration, subject to the limits discussed above, such that the overall proposed distribution revenue target for Rate Schedule BPL from page 2 of Schedule SS-E9 R-1 was achieved.

The distribution costs related to the use of the electric distribution system to deliver electricity to the streetlights are calculated by dividing the revenue requirements from the Local Delivery and System Delivery segments by the total kWh delivered. The Maintenance Charges that are listed in Rate Schedule BPL for use in calculating specialty prices and included in the charges for standard luminaires and poles were updated based on the latest information from the Company's accounting records.

<u>Rate Schedule Body Politic Lighting Service From Publicly Owned Facilities ("BPL-POF")</u>

Q. Please describe the rate design for Rate Schedule BPL-POF.

A. The Company closed this Rate Schedule at the conclusion of the 2018 Rate Case. and the rate class is grandfathered to premises receiving service only up to the date of October 31, 2018. Under Rate Schedule BPL-POF, the Company continues to provide only maintenance and electric delivery service for existing publicly owned street lighting systems that began taking service prior to the closing date of October 31, 2018. The Rate Schedule includes monthly charges for those luminaire types presently being served.

The distribution costs for this service are related to the use of the electric distribution system to deliver electricity to the streetlights and are calculated by dividing the revenue requirements from the Local Delivery and System Delivery segments divided by the total kWh delivered.

The fixed per unit charge for each luminaire is designed to provide for recovery of only the maintenance costs associated with providing service. The Company has no investment in the luminaires because all equipment is supplied, installed, and owned by the customer. The unit prices for each luminaire type were set in a manner identical to that of the Maintenance

Charge for Rate Schedule BPL to recover the Proposed Distribution Revenue for Rate Schedule BPL-POF as set forth in page 2 of Schedule SS-E9 R-1.

The Company proposes this class receive the increase as shown in Column 7 of Page 2 of Schedule SS-E9 R-1. Similar to Rate Schedules BPL and PSAL, the Company proposes to increase the Distribution Charge per kWh utilizing the standard increase limits, the Monthly Charges per Unit to recover the remainder of the revenue for this rate schedule.

<u>Rate Schedule Private Street and Area Lighting Service ("PSAL")</u>

Q. Please describe the rate design for Rate Schedule PSAL.

A. The rate design used for Rate Schedule PSAL individual luminaires and poles is similar to the method used for Rate Schedule BPL individual luminaires and poles. The only difference is that because this type of lighting service is optional, as customers may install their own systems that provide comparable lighting, it is appropriate that overall pricing of Rate Schedule PSAL should not be limited to the cost based revenue requirements as indicated by the COSS. The only difference for PSAL compared to BPL is the proposed changes for individual Standard pole charges were limited to a range to ensure an aggregate increase of 20.607% to all luminaire and pole revenue. This is shown on Column 7 of Page 2 of Schedule SS-E9 R-1.

The distribution costs for this service are related to the use of the electric distribution system to deliver electricity to the streetlights and are calculated by dividing the revenue requirements from the Local Delivery and System Delivery segments by the total kWh delivered.

RATE DESIGN FOR FUTURE ADJUSTMENT BETWEEN BASE RATE CASES

Q. Will the same method for revenue changes being proposed in this proceeding be used for future rate adjustments for IIP Proceedings and similar base rate adjustment programs prior to the conclusion of the next base rate?

A. While the method would be similar, the Company is proposing minor modifications that were used in similar rate adjustments since the 2018 base rate case.

Q. What modifications is the Company proposing?

A. Since the Streetlighting Rate Schedules (BPL, BPL-POF and PSAL) Luminaire and Pole Charges are specifically intended to recover the costs for those assets and have no cost relationship to investments being made in the Company's IIP proceedings and similar base rate adjustment programs, the Company proposes to exclude the luminaire and pole revenue from being included in the interclass revenue allocation for the corresponding future rate increases. Only the Distribution Charge revenue for the Streetlighting Rate Schedules would be included utilizing the same interclass revenue increase limits and the same rate design method specifically to the Distribution Charges proposed in this proceeding.

TAX ADJUSTMENT CREDIT ("TAC")

Q. Please briefly describe the TAC Mechanism.

A. The TAC mechanism was established in the 2018 Rate Case Order, to flow back certain tax benefits to customers.

Q. Please briefly describe PSE&G's proposed TAC adjustments.

A. As described in more detail in the testimony of Mr. Pardo, the Company is proposing the following adjustments to the TAC:

1) In addition to continuing to flow back the benefit of the historic Safe Harbor Adjusted Repair Expense ("SHARE") deduction, the Company proposes to flow back to

customers the net federal tax benefit associated with the historical Mixed Service accumulated deferred income taxes ("ADIT") balance over approximately five years.

2) The Company proposes to add the current Mixed Service deduction net benefit to the current SHARE deduction net benefit already included in the TAC, but both at a pre-determined, fixed annual amount, with any excess to be flowed back to customers in a subsequent rate case; and

3) To better match the seasonal flow of Company pre-tax income, the Company began to amortize the monthly flow back of excess deferred income taxes ("EDIT") and SHARE on a seasonal basis in the 2023 TAC filing to match pre-tax income as described in the 2023 TAC cost recovery proceeding. In this proceeding, the Company is aligning the return calculation with the seasonal amortization methodology.

4) To anticipate additional guidance along with proposed and final regulations on the Inflation Reduction Act's newly enacted 15% corporate alternative minimum tax ("CAMT") and material changes to energy tax credit law, the Company may propose an adjustment to the TAC or other mechanism to capture the impact of further U.S. Treasury guidance on the CAMT, if such guidance is applicable to PSE&G. Any proposed amortizations would be included in columns 17-20 in worksheet 'RevReq-E' of WP-SS-TAC-1.xlsx.

Q. Does the Company have an amortization schedule for the proposed amortizations?

A. Yes, the proposed amortizations are included in summary format in rows 167-170 in worksheet 'RevReq-E' of WP-SS-TAC-1.xlsx for 2025 through 2028.

Q. How does the Company propose to modify the TAC revenue requirement formula based upon the changes discussed previously?

A. The TAC revenue requirement formula is calculated monthly and will be modified with the ***bolded items*** below:

TAC Revenue Requirement = (Amortization of Protected ADIT Balance +(Amortization of Historic SHARE ADIT) Balance + ***(Amortization of Historic MSC Deduction ADIT Balance*** *+ After-tax Return on Cumulative Historic SHARE Deduction ADIT Change +* ***After-tax Return on Cumulative Historic MSC Deduction ADIT Change*** *+* ***Pre-set*** *SHARE Deduction Flow-Through +* ***Pre-Set MSC Deduction Flow-Through*** *+ IRS Audit Electric Adjustments + Other Major Electric Tax Adjustments) +* ***(Amortization of CAMT*** *+ After-tax Return on CAMT) * Electric Revenue Factor*

See Schedule SS-TAC-2E R-1 for the monthly net revenue requirement calculations.

Q. What is the TAC amount for the initial period after base rates are projected to take effect in this proceeding?

A. The electric net revenue requirement for the initial 16-month period of September 1, 2024 through December 31, 2025 is a credit to electric customers of $161.9 million or $123.0 million on an annualized basis. See Schedule SS-TAC-1 R-1.

DISTRIBUTION ADJUSTMENT CHARGE AND STORM RECOVERY CHARGE ("SRC")

SRC Mechanism

Q. Please briefly describe the Company's proposed SRC.

A. As described in the testimony of Mr. McFadden, the Company is proposing a SRC to:

1. Recover the deferred major storm costs that have been incurred since 2018 with interest.
2. Defer and then recover future major storm costs, including interest, through subsequent true-up filings.

Q. Please describe the methodology used to calculate the SRC recovery.

A. The Company is proposing a new Distribution Adjustment Charge ("DAC") clause in its electric tariff with the SRC as a new component of the DAC. The DAC was proposed by the Company in its COVID-19 cost recovery filing where COVID-19 Recovery Charge would also be a component of the DAC. The details of the SRC and the recovery mechanism are described below. The following formula describes the SRC mechanism:

SRC Balance = Prior Month SRC Balance – SRC Revenue + Incremental Deferred Major Storm Costs + Interest Expense

Q. How will the SRC be charged or refunded to customers?

A. The Company proposes to charge or refund the SRC through a new component of the Company's proposed DAC in the Company's electric tariff. The charges will be applied to each kWh of a customer's usage and will apply to all electric customers.

<u>SRC Components</u>

Q. What is the Initial SRC Balance?

A. The Initial SRC Balance is the total incremental deferred major storm costs associated with major storms since the Company's last Base Rate Case in 2018 prior to the implementation of the SRC rate.

Q. What are the "Incremental Deferred Major Storm Expenses?"

A. The Incremental Deferred Major Storm Costs are those monthly costs that occur after the implementation of the SRC rate.

Q. What is the "Interest Expense?"

A. The Interest Expense is the monthly carrying costs related to the SRC Balance. It is calculated as following ((Prior Month SRC Balance + (– SRC Revenue + Monthly Activity + Prior Month SRC Balance)) / 2) x (Annual Interest Rate / 12). In calculating the Interest Expense, the annual interest rate is based upon the Company's interest rate obtained on its commercial paper and/or bank credit lines utilized in the preceding month. If both commercial paper and bank credit lines have been utilized, the weighted average of both sources of capital shall be used. In the event that neither commercial paper nor bank credit lines were utilized in the preceding month, the last calculated rate will be used. The interest rate shall not exceed PSE&G's overall rate of return as authorized by the Board as utilized in calculating revenue requirements for the corresponding period. The calculation of the monthly interest can be found in Schedule SS-SRC-1E R-1, Page 1.

Q. How does the Company propose to calculate the initial SRC Rate?

A. The Company proposes to set the initial SRC Rate to recover these costs over a three-year period including interest. The rate will be a rate applied to all electric customer. See Schedule SS-SRC-1E R-1, Page 2 for the calculation.

Q. When does the Company propose to submit subsequent SRC filings to change the SRC?

A. The Company plans to submit a periodic SRC filing to change the SRC rate if warranted based upon the projected SRC over/under balance.

Q. When will storm costs be reviewed for prudency?

A. The Company proposes that all storm costs will be reviewed as part of subsequent SRC filings.

Q. When is the initial implementation of the SRC anticipated to occur?

A. The SRC is proposed to be effective September 1, 2024 corresponding to the change in base rates as a result of this proceeding. If the Board approves new base rates earlier or later than September 1, 2024, the initial rate period and corresponding rate will be adjusted accordingly from the effective date of the Board Order.

Q. What is the SRC amount for the initial period after base rates are projected to take effect in this proceeding?

A. The electric net revenue requirement for the initial annual period of September 1, 2024 through August 31, 2025 is a charge to electric customers of $38.5 million. See Schedule SS-SRC-1E R-1.

<u>TARIFF CHANGES</u>

Q. Are you proposing any further changes to the proposed tariff?

A. Yes. Please refer to the Guide to Electric Tariff Changes, Exhibit P-1 Schedule 2.

<u>LOSSES</u>

Q. Is the Company proposing to update electric losses?

A. No, the Company is not proposing any update to electric losses in this proceeding.

<u>CLEAN ENERGY FUTURE – ELECTRIC VEHICLE ("CEF-EV") FUTURE RATE ADJUSTMENT MECHANISM</u>

Q. Why is the Company proposing a future rate adjustment mechanism in the filing?

A. In accordance with the CEF-EV Order, the Company anticipates that expenditures on the CEF-EV program will extend more than six months beyond the end of the test year and require annual rate adjustment filings. As stated in the CEF-EV Order, paragraph 24:

> CEF-EV investment that is not likely to be in-service by the end of six (6) months after the end of the test year, shall be deferred and placed in a regulatory asset. The Signatory Parties agree the Next Base Rate Case will remain open so that CEF-EV investment placed in service more than six (6) months after the end of the test year in the Next Base Rate Case will be reviewed and placed into rates, if deemed reasonable and prudent, as soon as practicable after the associated infrastructure has been placed into service, through annual roll-in filings following the Next Base Rate Case. The annual roll-in filings will include three (3) months of forecast data that will be trued-up with actual data no later than 20 days after the end of the final forecast month. The annual roll-in filing will request that new rates be implemented three (3) months after the end of the final forecast month. The

schedule of such annual roll-in filings shall be determined in the Company's Next Base Rate Case.

Q. What costs will be included in the future CEF-EV rate adjustments?

A. The CEF-EV Order permits the Company to recovery the following assets in future rate adjustments.

1. Portions of Pole to Meter ("PTM") investments that would have been collected via Contribution in Aid of Construction ("CIAC") payments from CEF-EV participants.
2. The regulatory assets from the deferral of the Behind the Meter ("BTM") rebates to CEF-EV participants.
3. The regulatory asset from the deferral of the Depreciation and Amortization expense associated with the assets from Item 1 and 2 above.
4. IT Investments that were made to support the program
5. The regulatory asset from the deferred return on the Items 1 through 3 above.
6. The regulatory asset from deferred Program O&M expense

Q. How does PSE&G propose to calculate the revenue requirements?

A. PSE&G proposes to calculate the revenue requirements associated with the CEF-EV's costs using the following formula:

*Revenue Requirements = ((Rate Base * Rate of Return) + Net of Tax Amortization and/or Depreciation + Tax Adjustment)* Revenue Factor*

This calculation is similar to the calculations utilized in PSE&G's Infrastructure Programs as approved by the Board in their respective Board Orders. The Company proposes to recover the revenue requirements through annual rate adjustment filings as described below, consistent with the Order approving the Program.

Q. Please describe the components and defined terms in PSE&G's proposed revenue requirement calculation.

A. The following is a description of each term proposed in PSE&G's revenue requirement calculation.

The term "Rate of Return" is PSE&G's overall weighted average cost of capital ("WACC") for the Program. PSE&G is proposing a return on its CEF-EV rate base based upon an authorized return on equity ("ROE"), Long Term Debt, Customer Deposits and corresponding capital structure including income tax effects. The Company proposes to utilize the latest WACC authorized by the Board in the Company's base rate case proceeding(s). See Schedule MPM-04 for the calculation of the proposed WACC utilized in the revenue requirement calculation. Any change in the WACC authorized by the Board in any subsequent electric, gas, or combined base rate case would be reflected in the appropriate corresponding rate adjustment filing explained in more detail below. Any changes to current Federal or State tax rates would also be reflected in an adjustment to the WACC. Additionally, the Company is proposing that for these future CEF-EV rate adjustments, the embedded cost of long-term debt should be the actual rate at the time the Company submits its update for actual results in the associated proceeding.

The term "Rate Base" refers to Gross Plant from the assets described earlier less the associated accumulated depreciation and/or amortization and less Accumulated Deferred Income Taxes ("ADIT"). Gross Plant is equal to all the assets described above and Allowance of Funds Used during Construction ("AFUDC") – both debt and equity components.

ADIT is calculated as Book Depreciation (Tax Basis) less Tax Depreciation, multiplied by the Company's effective tax rate, which is currently 28.11%. Cost of Removal expenditures are depreciated 100% in the year incurred for tax purposes. Please see Table 2 below for the book and tax depreciation rates for each asset, which were approved in the CEF-EV Order.

Asset	Annual Book Depreciation Rates	Tax Depreciation Years/Type[7]
Pole to Meter	2.00%	20 / MACRS
IT Investments	3.33%	3 / SL
Regulatory Asset (excl. O&M)	3.33%	Expense
Regulatory Asset - O&M	20%	Expense

*Based on investment based weighted average of EV Depreciation Rates

Table 2

Any future changes to the book, or tax depreciation rates, such as, but not limited to, reinstatement of "bonus depreciation" during the construction period of the Program and at the time of each base rate adjustment, will be reflected in the accumulated depreciation and/or ADIT calculation described above. The "Net of Tax Depreciation and/or Amortization" allows for recovery of the Company's investment in the Program assets over the useful book life of each asset class. For Plant in Service investment, the net of tax depreciation expense is calculated as the depreciation expense multiplied by one minus the current tax rate. Any future changes to the book depreciation or tax rates during the construction period of the Program and at the time of each base rate adjustment, would be reflected in the net of tax depreciation expense calculation described above.

The term "Tax Adjustment" refers to any applicable tax items that may impact the revenue requirement calculation for the Program.

The "Revenue Factor" adjusts the Revenue Requirement Net of Tax for federal and state income taxes, the BPU and Rate Counsel ("RC") Annual Assessments Fees. The tax rates reflect the current federal tax rate of 21%. The BPU/RC Assessment Expenses consist of

[7] "MACRS" = Modified Accelerated Cost Recovery System, "SL" = Straight Line

payments, based upon a percentage of revenues collected (updated annually), to the State based on the electric and gas intrastate operating revenues for the utility. The Company has utilized the respective BPU and RC assessment rates based on the 2023 fiscal year assessment. Any future changes impacting the revenue factor during the construction period of the Program and at the time of each base rate adjustment, would be reflected in the revenue factor described above.

Q. Do you provide a schedule showing a sample calculation of the revenue requirements?

A. Yes. See Schedule SS-CEF-EV-1 R-1 for a sample calculation of future revenue requirements for the CEF-EV program.

Q. How does the Company propose to recover the revenue requirements as described above?

A. The Company proposes to recover the revenue requirements associated with the Program via new CEF-EV rate components of its Infrastructure Investment Program Charges ("IIPCs") for the Electric Tariff. While not an IIP, this mechanism will allow for the inclusion of the CEF-EV rate adjustments into base rates.

The filing schedule based upon the Initial Filing date along with corresponding timing for, Investment as Of, Update for Actuals Filing, and Rates Effective dates for all electric and electric rate adjustment filings, assuming Board approval of this proceeding by September 1, 2024, is listed in the table below.

Each Initial Filing shall provide the actual cost and forecast for investment data, revenue requirement calculations, proposed CEF-EV rates, and related data to support rates based on CEF-EV costs.

The Update for Actuals Filing, updates all forecasted cost and investment data, revenue requirement calculations, proposed CEF-EV rates, and related information from the Initial

Filing to data based on all actual historical data. CEF-EV investments included in rates in the Update for Actuals Filing shall only include CEF-EV investment not in the Company's base rates and actually placed in-service according to the schedule below.

The Rates Effective dates for each filing below shall be as indicated in Table 3 below – the first day of the month following five months following the due date of the Initial Filing. The Company proposes three rate adjustment filings with dates to be determined based upon 60 days notice prior to the initial filing. Table 3 below shows the Company's proposed filing timeline for each rate adjustment filing.

CEF-EV Rate Adjustment Schedule			
Initial Filing	**Investment as Of**	**Update for Actuals Filing**	**Rates Effective No Earlier Than**
TBD	TBD + 2 mo	TBD + 3 mo	TBD + 5 mo + 1 Day

Table 3

Q. What rate design is the Company proposing to use for this base rate adjustment?

A. The Company proposes to use the rate design from the most recently approved base rate case proceeding.

Q. What will be the source of the capital expenditures you use to calculate the revenue requirements for future CEF-EV adjustments?

A. The actual and projected monthly cash flows for the Program will be provided in separate testimony from the CEF-EV Program witness.

Q. Will the Company continue to calculate a monthly investment deferral on CEF-EV investments that are recovered in base rates or future rate adjustments?

A. No. Once investment is included in customer rates through a base rate case proceeding or future rate adjustments, it will be excluded from the CEF-EV Monthly Investment Deferral calculation described above.

Q. How will the CEF-EV Regulatory Asset be reflected in subsequent base rate case proceedings?

A. Consistent with the CEF-EV Order, the Company will continue to seek recovery of and on the unamortized CEF-EV Regulatory Asset. This will include any Deferred Monthly Investment not yet recovered in rates and return on the unamortized CEF-EV Regulatory Balance as a component of rate base in the same manner as any other Utility Plant.

STAFF COSS METHODOLOGY

Q. Please explain why you are conducting the Staff COSS.

A. In the 2018 Rate Case proceeding, the Company agreed to perform a COSS in the manner prescribed by Staff. In accordance with this requirement, the Staff COSS and the summary of the resulting functional revenue requirements by rate class are being submitted with the Company's rate case filing. Specifically, Schedule SS-E13 R-1 contains the details of the complete COSS utilizing Staff's Method, Schedule SS-E14 R-1 is the Summary Report by Functional Segment based on Staff's Method, Schedule SS-E15 R-1 is the Functional Cost Summary of the Cost of Service Study results based on Staff's Method, and Schedule SS-E16 R-1 contains the Service Charge Calculations based on Staff's direction.

In the Stipulation that resolved the 2018 Rate Case, the parties made it clear that they were not agreeing that the Staff COSS was appropriate, was consistent with cost causation principles, or would be a useful guide in determining just and reasonable rates. Specifically, the Stipulation stated (at 11-12):

> All parties will be free to submit any number of alternative cost of service methodologies for the Board's consideration in future cases. The Company and

any Signatory to this agreement will have the right to file and support any COSS method it considers appropriate.[8]

Q. Does the Company believe that the Staff COSS provides a reasonable foundation for establishing just and reasonable rates in this proceeding?

A. No. The Staff COSS Methodology is not an appropriate methodology to use to establish just and reasonable rates because it does not achieve a result that is tied to cost causation. Instead, the Staff COSS method goes to great and often extraordinary lengths to allocate and functionalize costs away from residential customers and onto the shoulders of commercial and industrial customers. While it may be reasonable to moderate the level of increase to be borne by residential customers, the vehicle for doing so should not be a COSS that transfers costs to businesses operating in the Company's service territory. The Company has taken reasonable steps to moderate the increase in rates for Rate Schedules RS and GLP customers with its gradualism-based recommendations that limit the increases for those classes.

Q. What is the primary reason that you believe that the Staff COSS is inappropriate?

A. The fundamental error in Staff's Method for the vast majority of costs is that it proceeds from an assumption that a significant portion of the cost of electric distribution assets should be allocated to the rate classes based on the amount of energy consumed by each class. This general method is applied to virtually all assets in FERC Accounts E360 to E368, which comprise about 81% of the Company's total gross electric plant.

The method used in the Staff COSS to functionalize and allocate most costs has existed for many years and is usually referred to as the "Average and Excess" methodology. However, historically the "Average and Excess" method was used to allocate costs of electric generation

[8] 2018 Rate Case Order at Stipulation ¶ 25.

plant and gas production facilities where arguably there is an energy component because there is investment beyond that necessary to provide capacity at the time of peak load. There is no linkage between this methodology and electric distribution plant costs or operations. Contrary to the assumptions underlying the Average and Excess method, the Company's distribution planners and designers plan and install facilities to meet the peak demands of customers. The design of those facilities is not based on the amount of energy (kWh) they consume.

Chapter 6 of the NARUC Manual, which the Company has generally relied on for functionalization and allocation concepts, describes in detail various methods of functionalizing (or classifying) and allocating electric distribution plant. Table 6-1 on Page 87 of the NARUC Manual shows the general classification of each of the distribution plant accounts into either a demand related or customer related component. More specifically, Part II of this Chapter, which starts on page 90 discusses various allocation techniques and calculations, begins as follows:

> *"When the utility installs distribution plant to provide service to a customer and to meet the individual customer's peak demand requirements, the utility must classify distribution plant data separately into demand- and customer-related costs."*

Nowhere in the NARUC Manual does a suggestion appear that the cost of electric distribution facilities should be classified or allocated on the basis of energy usage.

The Staff COSS suggests that because distribution facilities carry the "average" load of customers, costs should be allocated based on the average load or even the number of kWh that flow through the wires. This methodology unreasonably ignores the fact that the vast majority of the costs of the distribution system are not caused by its average use. If the system were designed to transport deliveries at only the average amount of electricity, or the amount of energy that is transported and delivered on an annual basis, it would be a much different system. However, no responsible designer of an electric distribution system would ever design a system that would permit delivery of only the average daily or average annual use. Electric distribution system costs are incurred to serve the expected peak load or any particular circuit.

Q. Do you have particular concerns with the manner in which the Staff COSS methodology classifies and allocates the costs of particular electric distribution accounts?

A. Yes. These concerns are as follows:

<u>Accounts E360 to E362, E365, E366, E367 and E368</u>

These accounts include land, local distribution headquarters, substations, overhead conductors and devices, underground conduit, underground conductors and devices, and line transformers. Staff's COSS requires both the costs of this plant and the expenses associated with this plant to be separated into energy-related and demand-related components and allocated across the rate schedules using a kWh allocation for the energy-related portion and CP allocator for the demand costs, respectively. Staff's proposed classification and allocation ignores the fact that there is no relationship between the costs incurred for these plant items and the amount of energy consumed by various rate classes over an annual period.

<u>Accounts C389 to C399 – Common Plant and E303 Intangible Plant</u>

In Staff's COSS the plant and associated depreciation reserve booked to C389-C399 – Common Plant and to C303 – Intangible Plant associated with meter reading was separated into a customer related and demand related component. The allocation of the customer related portion is the same as the Company's methodology, but the demand related portion was allocated using the class non-coincident peak ("NCP") allocator.

The class NCP is a measure of the peak of each class of customers, regardless of when it occurs. Although used in past cost allocation studies by the Company, it is less accurate than the use of both the actual CP and actual sum of individual customer demands. There is no reason to use an approximate substitute (the NCPs) when the real drivers (the CPs and sum of individual customer demands) are available. For these reasons, Staff's method of allocation of Common and Intangible Plant is unreasonable.

<u>Accounts E902 – Meter Reading Expenses & E903 - Customer Records and Collection</u>

Under the Staff COSS, expenses booked to these accounts are separated into a customer-related and demand-related component via a 50% - 50% split. Staff's 50% - 50% spilt between customer-related and demand-related components is not supported by any explanation or cost justification. Classifying basically fixed meter reading costs as demand-related for recovery through variable energy or demand charges violates the most fundamental cost classification and allocation principles. The amount of energy used has no bearing on the cost to read a meter. The majority of the time a meter reader spends is not the actual reading of the meter, but simply travelling from one meter to another. Itis independent of the type, size, or usage of the customers in that class. The variable that drives the total meter reading related costs booked to these accounts is the number of customers. Staff's classification of meter reading expenses as demand costs should be disregarded.

<u>Subsequent Base Case Requirements</u>

Q. Do you believe that the Company should be required to complete the Staff COSS in subsequent base rate case filings?

A. No. The Company is requesting that this requirement not be included for the filing of its next base rate case.

Q. Does this conclude your direct testimony?

A. Yes. It does.

APPENDIX E1 - DETAILED REVIEW OF COST OF SERVICE STUDY

Set forth below are details concerning the COSS Modeling Procedures as well as the functionalization and allocation of particular costs in the Company COSS.

Modeling Procedure

After expenses or plant investment-related costs have been entered into the COSS model, usually by FERC account or groups of accounts, one modeling allocator is also entered which performs two functions. The allocator shows:

1. Which of the six segments, or functions, the particular plant or expense item has been attributed to, and
2. The basis on which the particular plant or expense item has been allocated across the rate classes.

The COSS model starts the calculation procedure by allocating the respective plant and expense items to rate classes. Rate revenues for each rate class are then target balanced such that the resulting ROR for each of these rate classes achieves the Company's proposed overall ROR. The model continues by separating all plant and expense items into the appropriate functional segment by rate class, according to the modeling allocator assigned to the particular plant or expense item.

ALLOCATOR NAMING CONVENTION

For consistency and simplicity of bookkeeping, a naming convention has been developed for the modeling allocators.

Direct Allocators

All modeling allocators that end in a dash and a number (such as SUMPK@PRI-04) are direct allocators, meaning that they:

1. Allocate the plant or expense item based on an external constant as indicated by the name of the modeling allocator. For example, the "SUMPK@PRI " in the above allocator denotes the sum of all customers' greatest peak demands as observed at the primary lines, and
2. Segments, or functionalizes, the plant or expense item into one of the six segments as indicated by the trailing number. For example, the "-04" from the above allocator denotes the Local Delivery segment. The segment numbering method used in our analysis is as follows:
    - Segment #2 – Street Lighting
    - Segment #3 – Access
    - Segment #4 – Local Delivery
    - Segment #5 – System Delivery
    - Segment #6 – Customer Service
    - Segment #7 – Measurement

Note that segment #1 is not used.

<u>Indirect Allocators</u>

All modeling allocators that do not end in a dash and a number (such as A&GEXP) are indirect allocators, meaning that they will both segment and allocate costs in the same proportion as other individual or groups of plant or expense items. The names of these modeling allocators are an indication of the items upon which this process takes place. In this example, the A&GEXP allocator segments and allocates costs in the same proportion as the Administrative and General ("A&G") expenses in aggregate.

ALLOCATION DETAILS

Intangible Plant

Electric intangible plant (Accounts E301 to E303) was not included in the study.

Production Plant

There is no Production Plant on the Company's books.

Transmission Plant

All of transmission plant (Accounts E350 to E359) is excluded from the Cost of Service study as I have previously discussed since it is not related to the regulated electric distribution business.

Distribution Plant

The majority of Distribution Plant (Accounts E360 to E374) (Schedule SS-E5 R-1, pages 1-2, lines 9 to 20) have been functionalized as follows:

- Substations, poles, wires, circuits and transformers have been functionalized either to the Local Delivery or the System Delivery segments
- Electric services have been functionalized to the Access segment
- Meters to the Measurement segment
- All electric street lighting related equipment to the Street Lighting segment

After this functionalization was completed, each account was then examined to determine the proper allocation of the functionalized costs across rate classes. Investment segmented as Local Delivery was allocated consistent with the prior discussion, to the applicable rates based on the sum of the applicable customers' individual peak demands other than specific exceptions as noted.

Investment segmented to the System Delivery segment was allocated across the applicable rate schedules based on each applicable class's contribution to the coincident peak (also known as the CP). The details of the functionalization and allocation for each of the major Distribution Plant accounts are as follows:

E360 - Land & Land Rights

The investment in land or right-of-ways related to directly providing service to the few customers on Rate HTS-HV was directly assigned to this rate. The investment in this Account associated with substations follows the functionalization and allocation of the substations (recorded in Account E362 Station Equipment). The remaining investment in this account is attributed to local distribution headquarters, which follows the functionalization and allocation of all distribution plant in aggregate.

E361 - Structures and Improvements

The portion of investment in this account associated with substations follows the functionalization and allocation of Account E362 Station Equipment. The remaining portion is attributed to local distribution headquarters plant and follows the functionalization and allocation of all distribution plant in aggregate.

E362 - Station Equipment

Distribution investment in switching stations was segmented to the System Delivery segment and allocated to all customers served at 26 kV (on Rate HTS-sub) and the remainder of the load for primary and secondary customers based on their contribution to CP.

The distribution plant attributed to High Voltage substations (termed class H substations) was also segmented to the System Delivery segment. These substations convert either 69 kV, 138 kV or 230kV power directly to primary voltages (usually 13 kV). Since this type of substation only provides service to primary and secondary customers, the investment was allocated across rates serving customers at primary and secondary voltages based on the CPs of these rate classes.

Plant recorded for all other substations, referred to as the subtransmission classes (A, B, D, and other classes of substations), were segmented to the System Delivery segment and allocated across the rate classes serving primary and secondary voltage customers based on the CPs of these rate classes.

E364 - Poles, Towers & Fixtures

Poles were first analyzed to determine their specific use. Those poles used for street lighting purposes were segmented to the Street Lighting segment and directly assigned to rates BPL and PSAL based upon the type of plant and number of each type being billed under each applicable rate. Although an analysis was performed to determine the portion of E364 directly related to providing service to customers on Rate HTS-HV, no assets were found.

The remaining pole investment was separated into three categories, based on its use, to deliver either secondary, primary and/or subtransmission voltages to customers. An analysis was performed utilizing the Graphic Information System ("GIS") facilities mapping system to determine the type and number of conductors attached to every distribution pole in the system.

The total investment in poles used to carry secondary voltage conductors was segmented to the Local Delivery segment and allocated to all secondary customers based upon the sum of individual secondary customer peak demands, consistent with the methodology previously explained. For pole configurations carrying conductors of several operating voltages, the appropriate secondary portion of the pole investment was segmented to the Local Delivery segment and allocated as stated above.

The portion of the investment in poles used to carry primary voltage conductors was segmented 50% to the Local Delivery segment and 50% to the System Delivery segment.

The plant segmented to the Local Delivery segment was allocated to all customers served at secondary or primary voltages based upon the sum of individual customer peak demands of these classes. Those investments segmented to the System Delivery segment were allocated to all customers served at secondary or primary voltages based on these classes' contribution to the system CP. To simplify modeling, a combined allocator named "PRIMARYLINES" was developed to perform this segmentation and allocation in one step.

Finally, the portion of the investment in poles used for carrying subtransmission voltage conductors was segmented 21.1% to the Local Delivery segment and 78.9% to the System Delivery segment, consistent with the methodology previously discussed. The subtransmission plant segmented to Local Delivery was directly assigned to Rate HTS-Subtransmission, while the investment segmented to System Delivery was allocated to customers served through non-Class H substations served at secondary, primary or subtransmission voltages based on these classes contribution to the system CP, consistent with the methodology previously discussed. Similar to what was done above, a combined allocator named "SUBTRANSLINES" was developed to perform this segmentation, assignment and allocation in one step.

E365 - Overhead Conductors and Devices

This account is comprised primarily of various types of wire and other overhead equipment of various plant types (i.e. #2 Al wire, #3 Al wire, 4kV single phase lighting arrestor, etc.).

The investment in conductors (wire) associated with dedicated street lighting poles (those used solely for street lighting) was first directly assigned to the Street Lighting segment in Rates PSAL or BPL based upon the number of overhead street lighting-only poles in each rate class. This investment was estimated as the typical pole-to-pole length of secondary wire most commonly used for street lighting purposes for each of these street lighting poles.

The remaining equipment was first separated into the voltage class in which it is used - secondary, primary, subtransmission or high voltage and was then segmented and allocated in a method similar to that discussed above for poles. Investment in equipment whose normal operation voltage could not be determined or is used for all voltages (such as grounding wire) was allocated in the same proportion as the total of Account E365 equipment whose operating voltage could be determined.

The one exception to this method is the investment in conductors and other associated equipment used to serve customers on HTS-HV which was segmented to the Access segment since it effectively comprises the service drop to these customers. This investment was then directly assigned to this rate class. Although an analysis was performed to determine the portion of E365 directly related to providing service to customers on Rate HTS-HV, no assets were found.

E366 - Underground Conduit

These investments follow the functionalization and allocation of Account E367 underground Conductors and Devices.

E367 - Underground Conductors and Devices

A detailed segmentation and allocation was performed on a similar basis as done for investments booked to Account E365 - Overhead Conductors.

E368 - Line Transformers

Investments in line transformers were functionalized to the Local Delivery segment. The embedded costs of all line transformers in service were linked to the customers being served by each type and size of transformer. The average cost, in dollars per kVA, of transformer capacity was multiplied by the sum of the peak demand of each customer class to arrive at a calculated total transformer investment by rate class. This value was then used as an allocator of booked transformer investment.

E369 - Services

Investment in electric services was first classified as either minimum or excess investment. This is done since the magnitude of the customer's use or peak demand in some cases requires the use of a larger size service wire. Since the increase in costs above that of the minimum sized service is driven by customer demands, they are more appropriately demand related costs. They are termed excess costs and are segmented to the Local Delivery Segment to be recovered through the rate component where other demand related costs are recovered. The minimum investment was determined for subsets of each rate class, as the installed cost of a service utilizing the minimum wire size installed for customers in that subclass. This portion was segmented to the Access Segment for recovery through the Service Charge. The subsets analyzed for Rate RS were comprised of the various type of housing stock, including single family detached, single family attached, two family, three to four family homes, five to nine family homes, and structures of ten or greater residential units. For the demand rates of GLP and LPL, the subsets were determined by electrical demand. The excess investment was determined as the additional cost, over the minimum cost, of the typical service utilizing the wire size most commonly installed for customers on each rate class subset.

<u>E370 - Meters</u>

Given that new AMI meters are relatively the same cost for customers in each rate class, the meter investment booked in FERC Account E370 was segmented to the Measurement segment and allocated across the rates based upon the relative installed cost of new meters.

E373 – Street Light and Signal Systems

The costs charged to this account include all street lighting luminaires, decorative street lighting poles, and miscellaneous devices such as shrouds and brackets. All costs related to street lighting luminaires and miscellaneous devices have been segmented to the Street Lighting segment and are directly assigned to the two street lighting Rate Schedules BPL and PSAL based upon the number and type of luminaires and other devices billed under each rate. Local municipalities are only charged for the luminaires used for public street lighting in overhead areas since the luminaires can be mounted on already existing distribution poles. Since this is not the case in declared underground zones, in order not to burden the municipality with the expense of the underground street lighting poles, standard underground poles have been provided at no charge. The investment related to these poles provided at no charge has been segmented and allocated in the same proportion as distribution plant excluding meters. The investment in poles for other than these purposes have been segmented to the Street Lighting Segment and directly assigned to the two street lighting Rate Schedules BPL and PSAL based upon the number and type of poles billed under each rate.

Asset Retirement Obligations

The amounts for Asset Retirement Obligations (or AROs) booked to Account E374 was found to be almost exclusively related to poles and towers booked to Account E364, thus were functionalized and allocated in the same proportion as performed for the plant in Account E364.

General, Common and Other Plant

An accounting code, or Business Code, associated with the actual gross plant balances indicating the department to which the plant is assigned was used to segment both the general

(Accounts E389 to E399) and common (Accounts C389 to C399) plant account items (Schedule SS-E5 R-1, page 1). Each Business Code was then grouped by function to be allocated based on cost causation. For example; a Description for office furniture and equipment was added to the Customer Service segment and allocated in the same proportion as all Customer Service activities. In other cases, where some of the facilities, such as vehicles, etc. used by the Customer Operations Department are shared between groups that are responsible for meter reading and those that provide general customer service (collections, phone inquiry, walk-in payment centers, etc.), these investments were further split in the Cost of Service Study between the Measurement segment and the Customer Service segment based on the proportion of work performed by each group. In general, all general and common investments were allocated to the rate schedules in the same proportion as the overall respective plant accounts for each segment. Items for which no reasonable functionalization could be determined were classified as "unassigned" and allocated in the same proportion as its associated plant account. In other words, unassigned general plant followed general plant and unassigned common plant followed common plant (general plant, common plant and other plant are shown on Schedule SS-E5 R-1, pages 11-12.

Depreciation Reserve

The depreciation reserve associated with each Account was segmented and allocated in the same proportion as its associated plant account (Schedule SS-E5 R-1, pages 15-18, lines 1 to 93).

Adjustments to Develop Rate Base

Adjustments to net plant used to develop Rate Base consist primarily of capital added since the end of the COS year, working capital and deferred taxes for the distribution utility.

Most capital additions used allocated based upon distribution plant with other additions allocated to total net plant. The capital rate base adjustment associated with the CEF-EC program were allocated based upon the underlying meter costs for the RS and GLP rate schedules. In addition, approximately $440M of distribution net plant additions associated with CEF-EC were reclassified into the CEF-EC adjustment, with a total CEF-EC adjustment of approximately $670 million. The underlying components of working capital were analyzed and segmented according to their individual use. Working capital requirements associated with Material and Supplies, Cash, Prepayments, and Working Funds were allocated and segmented in the same proportion as the sum of O&M and capital additions (essentially cash outlays) through the use of the allocator termed "EXPENDITURES." Deferred taxes were segmented and allocated in proportion to the related plant values. These adjustments are indicated in Schedule SS-E5 R-1, pages 19-20, lines 1 to 36.

Operating Revenues

The values indicated in Schedule SS-E5 R-1, pages 3-4, line 56 entitled "Rate Revenue from Customers" are the portion of the total target balanced revenue requirements necessary to be recovered from rate-related revenues (from service charges, distribution charges, minimum charges, etc.) at the proposed overall ROR, plus the increase in non-rate-related revenues. The effects of other non-rate-related revenues are booked to Accounts E450 to E456 and are shown in Schedule SS-E5 R-1, pages 21-22, lines 10 to 11.

Production Expenses

Similar to the production plant items, there are no production expenses (Accounts E500 to E557) remaining on the Company's books.

Transmission O&M Expenses

Similar to Transmission Plant, these items were excluded from the Cost of Service study.

Distribution O&M Expenses

O&M expenses (Accounts E580 to E598) were generally segmented and allocated in the same proportion as their associated plant account(s) (Schedule SS-E5 R-1, page 23-24, lines 14 to 48).

Customer Accounts, Service and Sales Expense

Expenses from a wide range of customer contact activities are booked to Accounts E901 to E916. A separate analysis was performed on the costs charged to each of these accounts to determine the best functionalization fit. The details of this account-by-account functionalization can be found on Schedule SS-E5 R-1, pages 25-28, lines 59 to 109. The costs in each of these accounts related to meter reading were segmented to the Measurement segment and allocated on the basis of the costs to read meters for each rate class. The portion related to billing was segmented to the Customer Service segment and allocated on the relative costs of billing by rate class. The portion related to account maintenance activities (including answering general questions, setting up new accounts, remittance processing, and collection activities) was segmented to the Customer Service segment and allocated on the relative costs of performing these activities by rate class. The portion of these expenses related to general regulated utility responsibilities was segmented to the Local Delivery segment and allocated on the relative costs of performing these activities by rate class. The portion of Customer Records and Collection costs (Account E903 and E905) associated with costs to disconnect customers for non-payment of bills (and their eventual reconnection) were segmented to the Customer Service segment and allocated based upon the number of customers.

Where Customer Accounts expenses are recovered through the Societal Benefits Charge ("SBC"), such expenses were excluded from the Cost of Service study as indicated in Schedule SS-E3 R-1.

<u>Administrative and General ("A&G") Expenses</u>

These expenses (Accounts E920-935) include an eclectic mix of types of expenditures, which were analyzed separately to determine the best functionalization fit. The details of this item-by-item functionalization can be found on Schedule SS-E5 R-1, pages 27-28, lines 115 to 127.

<u>Depreciation and Amortization Expenses</u>

All depreciation and amortization expenses were segmented and allocated in the same proportion as their associated plant accounts (Schedule SS-E5 R-1, pages 29-30, lines 1 to 29).

<u>Pro Forma Expense Adjustments</u>

The pro forma adjustments the Company is proposing are summarized in Schedule MPM-29 and detailed as Adjustments #1 to #24 in Schedules MPM-30 through MPM 53of Mr. McFadden's direct testimony in this proceeding. With the exception of the pro forma adjustments discussed below, the balance of the adjustments related to electric distribution are included in the Cost of Service Study (Schedule SS-E5 R-1, pages 31-32, lines 11 to 45)

Each pro forma adjustment included in the Cost of Service Study was segmented and allocated in the same proportion as the associated plant or O&M account(s). The Cost of Service modeling of Pro-Forma #3 associated with Interest Synchronization, Pro-Forma #5 associated with Electric COLI Interest Expense, and Pro-Forma #7 associated with Gains and

Losses on Sales of Property all include the added income tax effects on revenue requirements as an additional expense.

Pro-Forma #6 associated with Weather Normalization, Pro-Forma #15 associated with Energy Strong II/IAP, Pro-Forma #19 associated with CEF-CE, Pro-Forma #21 associated with CIP, and Pro-Forma #22 associated with TAC are excluded from the Cost of Service Study (Schedule SS-E5 R-1) since these adjustments would be classified as revenue adjustments and do not impact distribution costs.

Taxes

All Taxes and Tax Deductions were segmented and allocated in the same proportion as their associated plant or O&M account(s). Details of these allocations are indicated on Page 35-44of Schedule SS-E5 R-1.

CREDENTIALS
OF
STEPHEN SWETZ
SR. DIRECTOR-CORPORATE RATES AND REVENUE REQUIREMENTS

My name is Stephen Swetz and I am employed by PSEG Services Corporation. I am the Sr. Director - Corporate Rates and Revenue Requirements where my main responsibility is to contribute to the development and implementation of electric and gas rates for Public Service Electric and Gas Company (PSE&G, the Company).

<u>WORK EXPERIENCE</u>

I have over 30 years of experience in Rates, Financial Analysis and Operations for three Fortune 500 companies. Since 1991, I have worked in various positions within PSEG. I have spent most of my career contributing to the development and implementation of PSE&G electric and gas rates, revenue requirements, pricing and corporate planning with over 20 years of direct experience in Northeastern retail and wholesale electric and gas markets.

As Sr. Director of the Corporate Rates and Revenue Requirements department, I have submitted pre-filed direct cost recovery testimony as well as oral testimony to the New Jersey Board of Public Utilities and the New Jersey Office of Administrative Law for base rate cases, as well as a number of clauses including infrastructure investments, renewable energy, and energy efficiency programs. A list of my prior testimonies can be found on pages 3 and 4 of this document. I have also contributed to other filings including unbundling electric rates and Off-Tariff Rate Agreements. I have had a leadership role in various economic analyses, asset valuations, rate design, pricing efforts and cost of service studies.

I am an active member of the American Gas Association's Rate and Strategic Issues Committee, the Edison Electric Institute's Rates and Regulatory Affairs Committee and the New Jersey Utility Association (NJUA) Finance and Regulatory Committee.

EDUCATIONAL BACKGROUND

I hold a B.S. in Mechanical Engineering from Worcester Polytechnic Institute and an MBA from Fairleigh Dickinson University.

COS Adjustments

Listing of plant and expense items listed in the BPU Report but not included in the COS modeling for reasons as indicated

line	FERC Account		Amount	Related to:
	Expenses			
1	E555 & E556 - Power supply expenses	$	1,882,177,949	BGS, NGC, & ZEC
3	E904 - Uncollectible Accounts	$	74,356,162	SBC
4	E905 - Misc Customer Accounts	$	132,818,250	USF/Lifeline
5	E908 - DSM Amortization	$	141,442,126	DSM Amortization
	Amortizations			
7	E407.3 - RAC Amortization	$	24,795,430	RAC Amortization
8	E908 - BRC Amortization	$	48,257,435	E-BRC Amortization
	Interest Charges			
9	E431 - Expense on Clauses	$	1,682,922	Interest Expense on all clauses
	Current Tax Adjustments & Deductions			
10	CECL Reserve	$	(158,427)	CECL
11	COVID Deferrals	$	(2,144,328)	COVID
12	Clause - Deferred Fuel	$	(542,814)	BGS
13	Clause - RAC (Environmental Clean Up)	$	1,574,751	RAC
14	Clause - Societal Benefits Clause (AAP)	$	624,526	SBC
15	Clause - Demographic Studies	$	5,963	GPRC
16	Clause - Navigant Studies	$	46,365	GPRC
	Deferred Taxes			
17	CECL Reserve	$	158,427	CECL
18	COVID Deferrals	$	2,144,328	COVID
19	Clause - Deferred Fuel	$	542,814	BGS
20	Clause - RAC (Environmental Clean Up)	$	(1,574,751)	RAC
21	Clause - Societal Benefits Clause (AAP)	$	(624,526)	SBC
22	Clause - Demographic Studies	$	(5,963)	GPRC

Notes:
1 Agreed upon in Settlement
2 Move toward cost limited at no decrease from current service charge and no increase greater than 1.5 times the overall average distribution % increase.
3 Access and Customer Service Rev Req per total GLP Customer plus Measurement Rev Req divided by the number of metered customers divided by 12; limits the same as Note 2
4 Access and Customer Service Rev Req per total GLP Customer divided by 12; limits the same as Note 2
5 Calculated at the GLP Access Segment per customer plus the GLP Customer Service Segment Revenue Requirements per customer plus the LPL-P Measurement Segment per customer divided by 12; limits the same as Note 2

<u>Electric Proof of Revenue by Rate Schedule</u>
<u>Explanation of Format</u>
The summary and each rate schedule provide the details of 1) a) Actual and b) Weather Normalized and also 2) a) Annualized Weather Normalized (all customers assumed to be on BGS and revenue based on current tariff rates) and b) the proposed rate design.

<u>1) Actual and Weather Normalized</u>
All the components are separated into Delivery and Supply. In addition to the Distribution components of Delivery, also included in the schedule are lines for Societal Benefits Charge, Non-Utility Generation Charge, Zero Emission Certificate Recovery Charge, Solar Pilot Recovery Charge, Green Programs Recovery Charge, Conservation Incentive Program, Tax Adjustment Credit, CIEP Standby Fee (as applicable), Facilities Charges, Miscellaneous items, Minimums, and Unbilled Revenue. The first column shows the actual billing units for the test year from Schedule SS-E2. The second column shows annual average rates (without Sales and Use Tax, SUT) occurring during the test period. The third column presents annualized revenue for the test period. The fourth column shows the weather normalized billing units for the test year from SS-E2. The fifth column shows the applicable rates. Column 6 presents weather normalized revenue. Columns 7 and 8 show the differential revenue, in thousands of dollars and percent increase, respectively, for each of the billing unit blocks.

<u>2) Annualized Weather Normalized (all customers assumed to be on BGS) and the Proposed rate design.</u>
All the components are separated into Delivery and Supply. In addition to the Distribution components of Delivery, also included in the schedule are lines for Societal Benefits Charge, Non-Utility Generation Charge, Securitization Transition Charges, Solar Pilot Recovery Charge, CIEP Standby Fee (as applicable), Green Programs Recovery Charge, Tax Adjustment Credit, Green Enabling Mechanism, Facilities Charges, Miscellaneous items, Minimums, and Unbilled Revenue. The first column shows the annualized weather normalized billing units for the test year from Schedule SS-E2. The second column shows present Delivery rates (without Sales and Use Tax, SUT) effective April 1, 2024. The Supply-BGS rates in the second column reflect the rates in effect April 1, 2024 and for CIEP energy, reflect the latest available 12-month class average hourly rates. The third column presents annualized revenue for the test period assuming all customers are provided service under their applicable BGS provision. The fourth column repeats the billing units of the first column. The fifth column shows the proposed rates that result in the proposed revenues shown in column 6. Columns 7 and 8 show the proposed revenue increase, in thousands of dollars and percent increase, respectively, for each of the billing unit blocks.

TYPICAL RESIDENTIAL ELECTRIC BILL IMPACTS

The effect of the proposed changes in the Rate Case 2023 (RC 2023) on typical residential Electric bills, if approved by the Board, is illustrated below:

Residential Electric Service - Average Monthly Bill					
If Your Average Monthly kWh Use Is:	And Your Jun. to Sep. Avg. Monthly kWh Use Is:	Then Your Present Monthly Bill (1) Would Be:	And Your Proposed Monthly Bill (2) Would Be:	Your Monthly Bill Change Would Be:	And Your Percent Change Would Be:
138	171	$34.22	$39.40	$5.18	15.14 %
277	342	63.47	70.72	7.25	11.42
553	684	122.38	133.79	11.41	9.32
650	803	143.36	156.21	12.85	8.96
1,000	1,300	219.92	238.41	18.49	8.41

(1) Based upon current Basic Generation Service Residential Small Commercial Pricing (BGS-RSCP) and Delivery Rates in effect April 1, 2024, and assumes that the customer receives BGS-RSCP service from Public Service.

(2) Same as (1) except includes increase in the RC 2023.

Residential Electric Service - Monthly Summer Bill				
If Your Monthly Summer kWh Use Is:	Then Your Present Monthly Summer Bill Would Be:	And Your Proposed Monthly Summer Bill (4) Would Be:	Your Monthly Summer Bill Change Would Be:	And Your Percent Change Would Be:
171	$42.37	$49.86	$7.49	17.68 %
342	79.80	91.66	11.86	14.86
684	155.82	176.43	20.61	13.23
803	183.47	207.14	23.67	12.90
1,300	299.01	335.40	36.39	12.17

(3) Based upon current Basic Generation Service Residential Small Commercial Pricing (BGS-RSCP) and Delivery Rates in effect April 1, 2024, and assumes that the customer receives BGS-RSCP service from Public Service.

(4) Same as (3) except includes increase in the RC 2023.

GAS COST OF SERVICE AND RATE DESIGN

Q. Please state your name, affiliation and business address.

A. My name is Stephen Swetz, and I am the Senior Director – Corporate Rates and Revenue Requirements for PSEG Services Corporation. My principal place of business is 80 Park Plaza, Newark, New Jersey 07102. My credentials are set forth in the attached Schedule SS-G1 R-1.

Q. Please describe your responsibilities as Senior Director – Corporate Rates and Revenue Requirements.

A. In this position I have, among other things, responsibility for the development of rates and tariffs for Public Service Electric and Gas Company ("PSE&G" or "Company").

Q. Have you previously testified in proceedings before the New Jersey Board of Public Utilities ("Board" or "BPU")?

A. Yes. I have both submitted written testimony and testified live before the BPU in a number of proceedings that are identified in Schedule SS-G1 R-1.

<u>**SCOPE OF TESTIMONY**</u>

Q. What is the purpose of your direct testimony in this proceeding?

A. The purpose of my direct testimony is to support the Company's proposed changes to its rates for Gas Service, which are designed to recover the revenue requirements for the gas distribution business as presented in this filing. My testimony provides the Company's embedded cost of service study ("Company COSS") used as the basis for development of the new gas rates and the proposed rate design for each rate schedule in PSE&G's Gas Tariff. I also present an alternative embedded cost of service study ("the Staff COSS") as required under the 2018 Rate Case Order and explain why that COSS should not be used to set rates in this case.[1]

Additionally, I sponsor other studies and modifications to the Company's Tariff for Gas Service ("Tariff") including the following:

- Recovering Gas Bad Debt Costs consistent with method used in electric business; and
- The establishment of a Storm Recovery Charge ("SRC") to recover major storm costs as a component of a proposed Distribution Adjustment Charge ("DAC") that was previously proposed as part of the COVID-19 cost recovery proceeding;[2]
- Tax Adjustment Credit ("TAC") modifications.

I also sponsor the Company's proposed Tariff, which is attached to the Company's Petition in Exhibit P-1 as Schedule 3.

[1] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of an Increase in Electric and Gas Rates and for Changes in Tariffs for Electric and Gas Service, B.P.U.N.J. No. 16 Electric and B.P.U.N.J. No. 16 Gas, and for Changes in Depreciation Rates, Pursuant to N.J.S.A. 48:2-18, N.J.S.A 48:2-21 and N.J.S.A. 48:2-21.1, and for Other Appropriate Relief*, BPU Docket Nos. ER18010029 & GR18010030; *I/M/O the New Jersey Board of Public Utilities' Consideration of the Tax Cuts and Jobs Act of 2017*; BPU Docket No. AX18010001; *I/M/O Public Service Electric and Gas Company for Approval of Revised Rates (Effective on an Interim Basis April 1, 2018) to Reflect the Reduction Under the Tax Cuts and Jobs Act of 2017*, BPU Docket No. ER18030231, Decision and Order Adopting Initial Decision and Stipulation (October 29, 2018) (the "2018 Rate Case Order"), paragraph 25.

[2] *I/M/O the New Jersey Board of Public Utilities Response to the COVID-19 Pandemic*, BPU Docket No. AO20060471, PSE&G filing titled *I/M/O the Petition of Public Service Electric and Gas Company for Approval of Incremental COVID-19 Costs for Recovery Through a New Special-Purpose Clause, and for Authorization to Recover Uncollectible Costs for Gas Through the Societal Benefits Charge* (July 17, 2023).

Q. Do you sponsor any schedules as part of your direct testimony?

A. Yes. I sponsor the following schedules that were prepared and/or compiled by me or under my direction and supervision:

SCHEDULE DESCRIPTION	NUMBER
Qualifications of Stephen Swetz	SS-G1 R-1
Basis of Calculations Schedules	
Actual and Weather Normalized Billing Determinants	SS-G2 R-1
COSS Adjustments	SS-G3 R-1
Cost of Service Schedules	
Details of Complete COSS	SS-G4 R-1
COSS Summary Report by Functional Segment	SS-G5 R-1
COSS Revenue Requirements by Rate and Function	SS-G6 R-1
Sync with Rate Design	SS-G7 R-1
Rate and Rate Design Schedules	
Inter Class Revenue Increase Allocations	SS-G8 R-1
Service Charge Calculations	SS-G9 R-1
BGSS Calculations	SS-G10 R-1
Proof of Revenue by Rate Schedule	SS-G11 R-1
Typical Customer Bill Impacts by Rate Schedule	SS-G12 R-1
Staff's Cost Allocation Methodology Related Schedules	
Details of Complete COSS – Staff's Method	SS-G13 R-1
Summary Report – by Functional Segment – Staff's Method	SS-G14 R-1
Functional Cost Summary – Staff's Method	SS-G15 R-1

<u>OVERVIEW OF THE COMPANY'S RATE FILING AND BASIS OF CALCULATIONS AND ANALYSIS</u>

Overview

Q. What terminology does your direct testimony use regarding revenue and rates?

A. Throughout this testimony, the revenue or percentage increase for "Distribution" is based only on revenue from the Service Charge and Distribution Charge(s) for the particular rate schedule. The term "Delivery" refers to revenue from the Service Charge and Distribution Charges as indicated on the particular rate schedule, plus the revenue from the Balancing Charge and all of the applicable adjustment clauses. The "Total Bill" equals the Delivery Charges plus gas supply, and is calculated as if all customers were supplied on Basic Gas Supply Service ("BGSS").

Q. Please describe the gas distribution services provided by the Company.

A. The Company provides gas distribution services under the following Rate Schedules:

(i) Rate Schedule RSG sets forth the terms at which the Company provides firm delivery service for residential purposes;

(ii) Rate Schedule GSG sets forth the terms at which the Company provides firm delivery service to customers that do not qualify for Rate Schedule RSG and whose usage does not exceed 3,000 therms in any month;

(iii) Rate Schedule LVG sets forth the terms at which the Company provides firm delivery service for general purposes;

(iv) Rate Schedule SLG sets forth the terms at which the Company provides firm delivery service for gas street lighting purposes as well as lamp posts and maintenance;

(v) Rate Schedule TSG-F is a closed service that was available to customers who purchased or committed to purchase service prior to December 1, 1994 and whose maximum request for firm gas is not less than 150 therms per hour;

(vi) Rate Schedule TSG-NF sets forth the terms at which the Company provides interruptible delivery service to customers whose maximum request for gas is not less than a 150 therms per hour; and

(vii) Rate Schedule CIG is a closed interruptible service that was available to cogeneration customers who purchased or committed to purchase service prior to January 9, 2002.

(viii) Rate Schedule CSG is a firm or interruptible delivery service for general purposes where the customer is requesting a discount rate from a Public Service Rate Schedule for delivery service based on an (a) Economically Viable Bypass alternative or (b) Other Considerations.

Q. Please provide an overview of the Company's filing in this proceeding.

A. As described more fully by Company witness Mr. Michael McFadden's, PSE&G is seeking to increase its base delivery rates effective September 1, 2024 by approximately $401 million annually for its gas distribution business. As discussed further by Mr. McFadden and Company witness Mr. Cliff Pardo, the Company further proposes to make certain modifications to the Company's TAC, including flowing back Mixed Service deductions to customers. This change will reduce gas rates by approximately $98 million annually. In addition, the Company is proposing the SRC to recover major storm costs, increasing gas rates by approximately $1 million annually. Finally, the Company is proposing to recover it gas bad debt costs through a new Social Programs component of the SBC for approximately $34 million. My testimony provides support on how these changes will impact rates.

Q. How have Gas distribution charges changed since the 2018 base rate case?

A. Gas distribution charges have increased at a compound annual growth rate ("CAGR") of 4.3% as shown in Figure 1. This increase is primarily driven by work to modernize the Gas system and replace cast iron and unprotected steel mains, which provide both a reliability and carbon emissions benefit to customers. Despite the considerable investment to modernize the gas system, the distribution charge CAGR for a residential customer using 1,000 therms per year is less than half of the statewide average of 10.6%. PSE&G's charges have increased considerably less than the New Jersey average because PSE&G has been able to control costs and maximize the value of its prior investments.

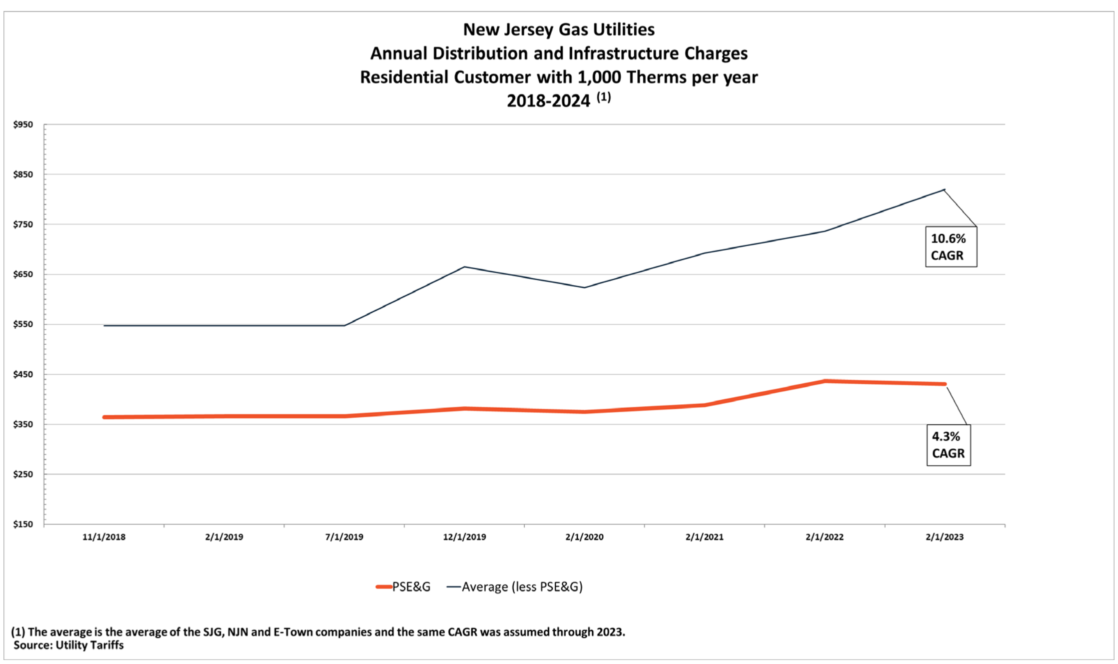

Figure 1

Q. That shows that PSE&G's Distribution charges are lower than average, but how does PSE&G compare on a total bill basis?

A. PSE&G continues to be lower than the average compared to its peers. In New Jersey, PSE&G remains on the lower cost side compared to of all of its peers in terms of the total gas and electric bill. Further, as shown in Figure 2 below, the Company has the lowest monthly gas bill amongst all of its peers – almost 27% lower than the average, as set forth in Figure 2 below.

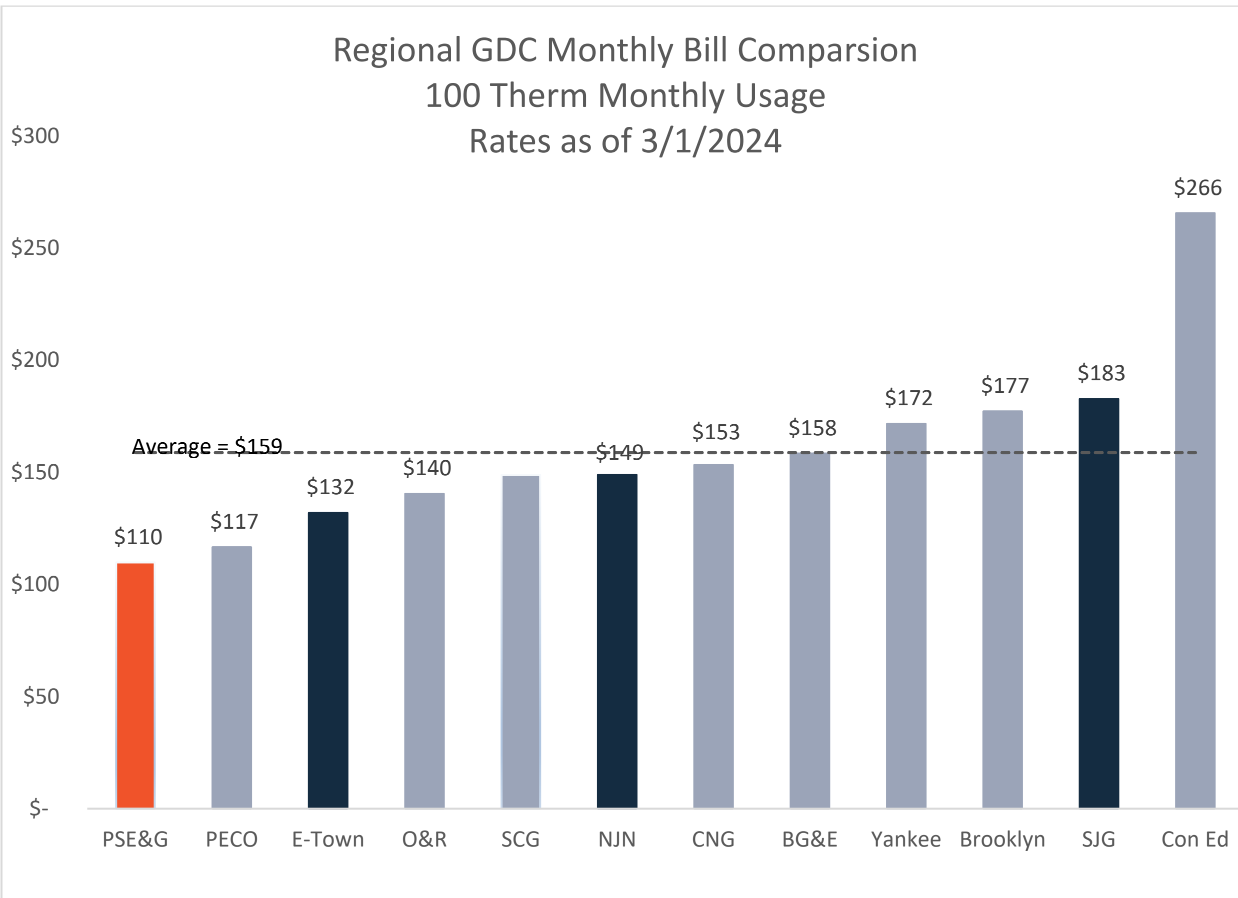

Figure 2

Q. How long has it been since PSE&G's last base rate case?

A. PSE&G filed its last base rate case on January 12, 2018, with new rates effective November 1, 2018. Since that time, every other NJ gas utility has filed at least two base rate cases.

Q. Why has PSE&G not filed a rate case until now?

A. As discussed in more detail below, this is primarily due to the Company's efforts to control costs. PSE&G takes very seriously its responsibility to customers to manage costs prudently and be good stewards of the gas distribution system and the customer funds needed to operate and maintain it effectively. This is achieved by regularly benchmarking Company costs and employee performance and creating appropriate employee incentives to continue to improve upon historic success.

Q. Please describe the efforts the Company has undertaken to protect lower-income customers from the impact of rate increases.

A. The Company is very focused on this vulnerable segment of our customer base. PSE&G's Energy Efficiency programs include incentives targeted to its lower income customers, with specific opportunities for both low and moderate income customers, who often face the highest energy burdens. The Company specifically seeks to provide energy savings opportunities to these customers in order to lower their energy burdens, as participants in the EE programs are expected to benefit from long term energy and bill savings, as well as health and safety improvements. The Company implements the State's Comfort Partners program to customers with incomes up to 250% of the Federal Poverty Level; that program provides free comprehensive energy savings solutions as well as upgrades to address health and safety problems in the home. PSE&G also recently filed its updated Clean Energy Future – Energy Efficiency II Program, which proposes to transfer administration of the Comfort Partners program to the Company in order further reduce market confusion and streamline the process for lower-income customers to take advantage of energy efficiency programs;[3] PSE&G believes this change in administration of the Comfort

[3] *I/M/O The Petition of Public Electric and Gas Company for Approval of its Clean Energy Future-Energy Efficiency II (CEF-EE I) Program on A Regulated Basis*, BPU Docket No. QO23120874 (filed December 1, 2023).

Partners program will significantly improve customer access to energy efficiency and allow the Company more flexibility in serving the needs of lower-income customers. Also as part of the Clean Energy Future – Energy Efficiency II Program, PSE&G proposed to continue to target low and moderate income customers by providing comprehensive energy assessments and free direct install of energy efficient measures and services to income qualified households with higher incentives and opportunities for no-interest financing for health and safety improvements to these customers (the Comfort Partners program does not include financing, as all measures are paid for by the program and free to eligible customers), and to continue to provide enhanced opportunities for customers in overburdened communities. PSE&G also offers higher incentives for high efficiency heating and cooling systems and continues to provide financial incentives to both property owners and tenants to install high efficiency equipment in apartments and other multifamily properties. The Company promotes the use of these programs to our customers through bill inserts and community outreach, conducting this communication in multiple languages where possible and appropriate.

Q. Are there other assistance programs for lower-income customers outside of PSE&G's energy efficiency programs, and if so, please describe those programs and who is eligible.

A. The Company also advocates at the State and Federal level for various grants provided to lower-income customers, including the Low-Income Home Energy Assistance Program ("LIHEAP"), Lifeline and Tenants Lifeline Program ("Lifeline"), and the Universal Service Fund ("USF"). LIHEAP is a Federal Block Grant program that helps low-income individuals and households pay for their winter heating bills, medically necessary cooling benefits, and weatherization. The Lifeline Program helps customers pay their utility bills with a $225 annual utility credit. To be eligible, a customer must be at least age 65, or at least age 18 and collecting

Social Security Disability. In addition, a single person must make less than $42,000, or a couple less than $49,000 annually. USF is a statewide program administered by the Department of Community Affairs that allows program recipients to pay no more than 3% of their income for electric and 3% for natural gas, or 6% for total electric, including electric heating for customers at or below 60% of the State median income. PAGE is a program for customers earning up to 500% of the Federal Poverty Limits and offers a grant of up to $700 per utility service. NJ SHARES is for customers earning up to 400% of the Federal Poverty Limit and is funded by customer donations which are matched by PSE&G.

PSE&G has more customers eligible for these low-income programs on a proportionate basis compared with other New Jersey utilities. This customer segment receives special focus.

Q. Are there steps PSE&G has taken during the COVID-19 pandemic to help these customers?

A. Yes. PSE&G, its customers, and New Jersey have faced unprecedented challenges as a result of the COVID-19 global pandemic that created difficult economic circumstances. In response to these challenges, PSE&G developed a comprehensive payment assistance outreach plan utilizing employees and contractors and conducted an external media campaign designed to provide customers opportunities to garner financial assistance and enter into deferred payment arrangements to avoid shut off.

Q. Has the Company considered the impact of gas rates on these customers?

A. Yes. As illustrated in the figure below, the relative cost of PSE&G's services to a typical combined (that is, electric and gas) residential lower-income customer has dropped significantly since 2009 and is essentially flat as compared with rates following the conclusion of the Company's 2018 base rate case.

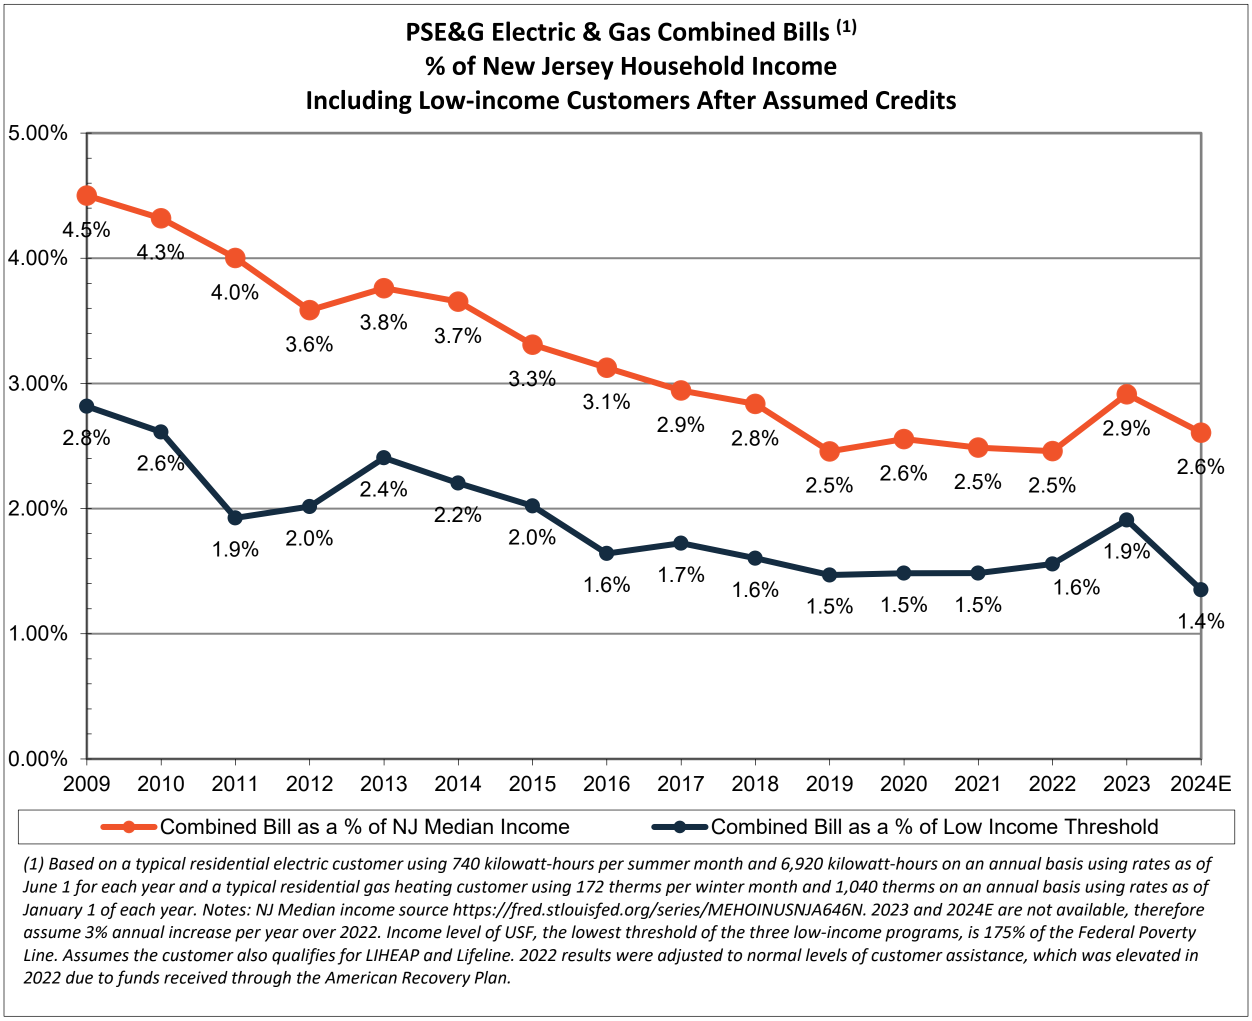

Figure 3

This chart compares the bill as a percentage of income for a typical combined electric and gas residential customer relative to New Jersey's median income and relative to the income threshold below which customers are considered low-income. As can be seen, for the average residential customer, the cost of service is less than 3% of median income. For lower-income customers, the cost of the bill after LIHEAP, USF, and Lifeline grants relative to an income level of 60% of State median income (the level at which a customer is eligible for these grants), is around 2% today. So, even with this proposed rate increase, the cost of electricity and gas for all of the Company's customers, including low-income customers, remains a very small portion of overall income for those able to take advantage of these programs.

Q. How does the current RSG Service Charge compare to other utilities?

A. As shown in the figure below, PSE&G's monthly RSG gas service charge is the lowest compared to similar gas utilities in the region.

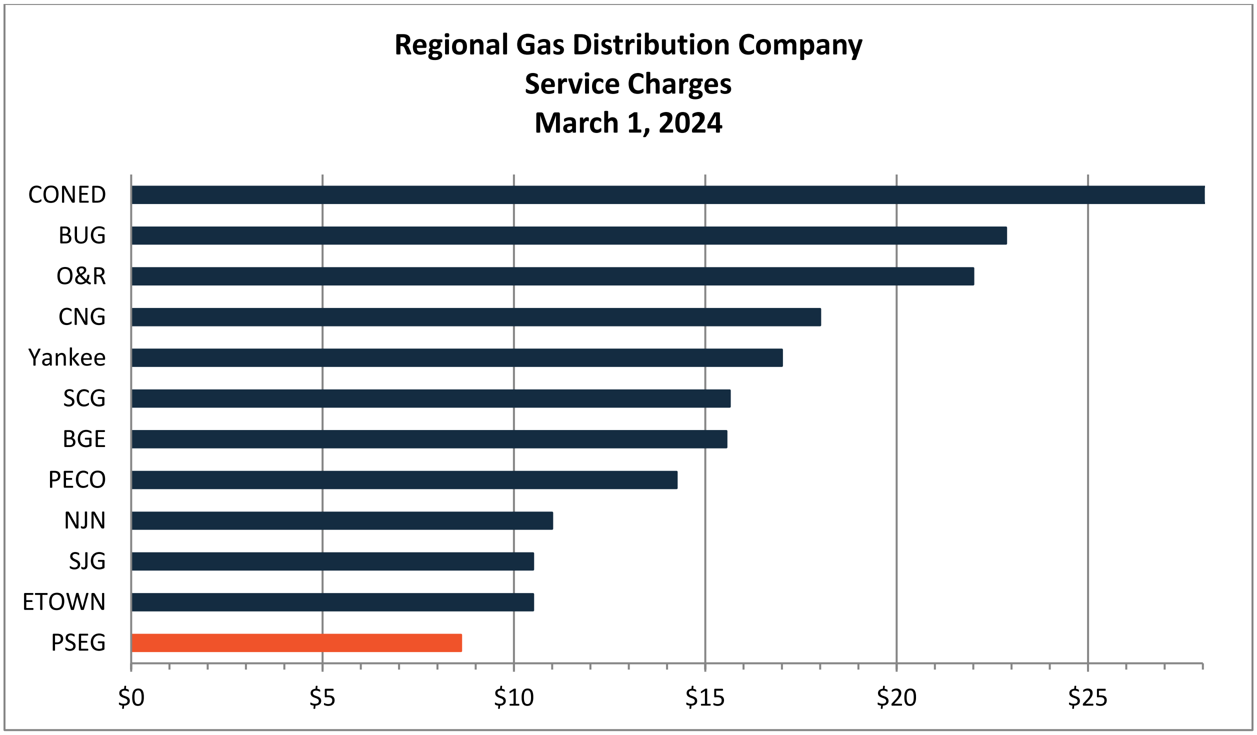

Figure 4

Q. What are the periods used for the COSSs and Rate Design that you are sponsoring in this proceeding?

A. The COSSs presented in this testimony are based upon the period of January 1 to December 31, 2022. The only variations from actual costs in the COSS period were the requested overall Rate of Return value, proposed rate base adjustments such as working capital requirements, and the proposed *pro forma* Adjustments. These adjustments, as well as the adjustments needed to synchronize the COSS results with the proposed rate design as discussed later in my testimony, and the rate design presented in this testimony are based upon the Test Year of June 1, 2023 through May 31, 2024 (hereafter "Test Year").

Q. What billing determinants will be used to determine the revenue requirement and rates that are being established in this proceeding?

A. The billing determinants used to establish rates and the revenue requirement in this proceeding will be the actual Test Year billing determinants as adjusted for normal weather. For the initial filing and any updates (prior to the final filing) with all actual data, the billing determinants will be a mix of weather normalized actual and forecasted billing determinants. Weather normalized billing determinants are calculated by adjusting actual recorded monthly gas sales to account for the effects of abnormal weather. A summary of the actual billing determinants, the weather normalized billing determinants, and the variation of each determinant from normal for the Test Year is shown in Schedule SS-G2 R-1.

Weather Normalization of Billing Determinants

Q. What weather pattern is used to weather normalize actual billing determinants?

A. The Company utilizes a twenty-year weather pattern as measured at Newark Liberty International Airport covering the period ended December 31, 2021.

Scope of the COSS

Q. Please describe the COSSs that the Company is presenting in this proceeding.

A. The Company is presenting two COSSs in this proceeding -- its recommended COSS is referred to as the "Company COSS" – and an additional COSS based on a methodology developed by BPU Staff. As discussed more fully below, the Company does not support the use of the Staff COSS to establish rates in this proceeding, but is submitting the study in compliance with the 2018 Rate Case Order. The COSSs discussed in this testimony are for the gas Distribution portion of the Company's operations. Thus the COSSs are generally "pipes only" analyses for the Company's regulated gas delivery business. They do not include the costs for the Company's Balancing Services or BGSS because rates for those services are set in another proceeding. The impact of changes in distribution margin revenues that flow to the BGSS provider, such as those associated with Rate Schedule TSG-F, will, however, be shown as a change in the BGSS charges to customers.

Adjustments to Accounting Data

Q. Did you make any adjustments to the accounting data used in the COSSs?

A. Several adjustments to the 2022 accounting data used in the COSSs were necessary prior to its use. These adjustments and FERC Accounts associated with each of these adjustments are shown on Page 1 of Schedule SS-G3 R-1.

In the rate design process, the unit charges associated with these adjustments will be added back as appropriate in each rate schedule to assure full recovery of these expenses. The Company COSS and the Staff COSS each include these adjustments to costs and billing determinants.

COSS OVERVIEW

Introduction

Q. What is the first step in developing new gas rates?

A. The first step in developing new gas rates is the preparation of an appropriate COSS. The Company COSS was used to both separate costs by functional segments and to allocate these segmented costs to the rate classes or sub-classes based upon each class's responsibility for that cost.

Q. What is the objective of a COSS?

A. The objective of a COSS is to measure the cost responsibility of each rate class and distribution function (functionalization).

Cost Allocation Concepts

Q. Please describe the cost allocation concepts used in the Company's COSS.

A. Inherent in any COSS is the allocation to rate classes of many costs which by their nature are difficult to relate precisely to cost causation. Cost causation describes the cause and effect relationship between customer requirements, load profile, and usage characteristics, and the costs incurred by the utility to serve those requirements. Experts will differ on the best way in which many costs should be allocated among customer classes. The key is to determine which approach makes the most sense in terms of best answering the question of what caused the cost, and then to apply the result in a reasoned, balanced manner. At all times, it is important to recognize that the COSS is intended to be a guide to appropriate ratemaking, and that one objective of ratemaking is that the end result should be a reasonable one.

As I will discuss later, I have used the results from the Company COSS as a direct guide in developing rates but tempered the final rate design to provide a reasonable balance between the goal of moving each rate schedule towards costs and the goal of achieving reasonable percentage increases based upon the resulting customer impacts.

General Cost Allocation and Functionalization Methodology

Q. What is the basis for the cost allocation and functionalization methodologies used in the Company COSS?

A. In the gas distribution business, the revenue requirements related to gas mains and services far exceed all other items. Together these facilities comprise the vast majority of rate base and are the basis for much of the operations and maintenance ("O&M") expenses. As previously stated, it is important to ensure that the allocation methods used in the COSS reflect the underlying cost causation principles. Gas mains have been, and continue to be, installed to bring gas service to the proximity of each customer's premise and are sized to handle the peak hourly gas flow at design conditions, without regard to the gas flow at any other time of day or season. These are the sole reasons and engineering basis for the design and cost of mains, and as such, the allocation of those costs should properly reflect each rate class's responsibility for the peak gas flow. Company witnesses Mike Schmid and Rick Fonseca discusses this in detail in the portion of their testimony entitled "Gas Capital Expenditures". In contrast to the cost of gas mains, the cost of a gas service (the pipe from the gas main to an individual building) is related to both the peak design loads of each building and the distance from the gas main (usually located in the street) to the structure itself. Because often one gas service serves more than one customer (or meter) in a building, the cost responsibility of a customer is a complex combination of site-specific conditions. The Company has relied on a study of actual installations of services and meters and employed that study to determine the allocation of gas service costs.

The methods of allocating the costs of mains and services used in the Company's COSS are based on sound cost causation principles and, as such, constitute a reasonable cost allocation methodology for the most significant categories of the Company's costs.

Functionalization into Five Segments

Q. What is the first step in the process to start a COSS?

A. As a first step in that process, the COSS unbundles total costs into five distinct functional segments – Distribution Access, Distribution Delivery, Street Lighting Fixtures, Customer Service, and Measurement.

Q. Once these functional segments are developed, how are they used?

A. These separate functions (or "segments") assist in the development of individual rate schedule components, such as the Service Charge. Once the plant and expenses are functionalized to the proper segment, the allocation process spreads the cost responsibility to the rate classes.

Q. What items are included in each of these segments?

A. The Distribution Access ("Access") segment includes the plant and O&M expenses related to gas services and regulators.

The Distribution Delivery ("Delivery") segment includes all equipment (plant and related O&M) from the city gate interconnections with upstream pipeline suppliers up to the point of connection with gas services, including all metering and regulation stations (the interface with the interstate gas pipelines), gas load dispatching operations, and gas mains. This segment also includes Appliance Services, recovery of regulatory assets, and the plant and non-commodity expenses related to gas production and storage facilities owned by PSE&G. Although these storage and production facilities are included in the Delivery segment, these costs are offset by the customer non-rate-related revenue received directly from the BGSS Supplier for whom these facilities are operated, as stipulated in the Gas Contracts Proceeding in Docket No. GM00080564, and thus do not affect the rates established in this proceeding.[4]

The Street Lighting segment is limited to gas street lighting lamps, posts and services.

The Customer Service segment includes all costs related to billing, inquiry, sales, service and collection activity.

---

[4] *See In the Matter of the Petition of Public Service Electric and Gas Company's Proposal to Transfer its Rights and Obligations Under its Gas Supply and Capacity Contracts and Operating Agreements to an Unregulated Affiliate and Other Relief*, BPU Docket No. GM00080564.

The Measurement segment includes the costs for meter reading, customer-related meter plant and meter O&M.

Q. Are all costs included in these five segments?

A. Yes, all costs are included in one or more of these of five functional segments.

Access Segment

Q. Please discuss how the Access segment was allocated among the Company's customers classes.

A. The Access segment is the initial link between the shared or common distribution system and the customer's own gas facilities and is comprised of the gas service line from the main in the street to the meter and regulator at the customer's building. The embedded costs for this segment were allocated across the rate classes based on a study of actual installations of gas services.

Delivery Segment

Q. Please discuss how the Delivery segment was allocated among the Company's customer classes.

A. The Delivery segment consists of the portions of the distribution system that are used to serve multiple customers and are physically connected with individual customers' service lines. Basically, this segment includes all of the gas mains in the distribution system. The embedded costs of this segment were allocated across the rate classes through a variety of direct and indirect allocators which are discussed in greater detail in Appendix G-1.

Street Lighting Fixtures Segment

Q. Please discuss how the costs were allocated to the Street Lighting segment.

A. This segment is comprised of the investment for gas street lighting lamps and poles and all associated O&M expenses for this equipment. The gas service dedicated to supplying a gas streetlight is also segmented to this function. The costs of this segment are allocated solely to the Gas Streetlighting rate class.

Customer Service Segment

Q. Please discuss how the Customer Service costs were allocated to the Company's customer classes.

A. This segment encompasses all costs related to Customer Service type functions, such as costs related to billing, payment receipt and processing, collection activity, and other account maintenance type costs, with the exception of meter reading costs, which are included in the Measurement segment. These costs are allocated to the rate classes based upon a separate cost study of Customer Service functions.

Measurement Segment

Q. Please describe how the Measurement segment costs were allocated to the Company's customer classes.

A. This segment includes costs for meter reading and the investment and O&M expenses related to meters. Meter reading costs are allocated to the rate classes based upon a separate cost study of Customer Service functions, while the meter investment is allocated across the rate classes based upon the relative installed cost of new meters.

Modeling Procedure

Q. Please describe the Company COSS modeling procedure.

A. The Company COSS was developed based upon the weather normalized billing determinants and costs for each of the rate schedules. The revenues received by each rate class were calculated (or target balanced) such that the resulting rate of return ("ROR") for each rate class equals the Company's proposed overall ROR. Schedule SS-G4 R-1 contains the complete details of these final COSS results. Schedule SS-G5 R-1 presents a summary report of the revenue requirements by functional segment, while Schedule SS-G6 R-1 shows the revenue requirements by function (or segment) for each rate class.

Although Rate Schedule TSG-F and its associated costs are modeled in the COSS, all distribution revenue from Rate Schedule TSG-F flows to the BGSS provider as an offset to the "Non-Gulf Coast Cost of Gas." The revenue requirements associated with Rate Schedule TSG-F must therefore be recovered from the remaining firm customers. The allocation of these revenue requirements will be discussed in detail later in the section titled "Synchronizing the Cost of Service Study to the Rate Design".

After expenses or plant investment-related costs have been entered to the model, usually by FERC account or groups of accounts, a modeling allocator is also entered which performs two functions. The allocator shows:

1. Which of the five segments, or functions, the particular plant or expense item has been attributed to, and
2. The basis on which the particular plant or expense item has been allocated across the rate classes.

The Cost of Service model starts the calculation procedure by allocating the respective plant and expense items to rate classes using an allocator that reflects the reason the cost was incurred. Rate revenues received by each rate class are then target balanced such that the resulting ROR for each rate class equals the Company's proposed overall ROR. The model continues by separating all plant and expense items into appropriate functional segments by rate class, according to the modeling allocator assigned to the particular plant or expense item. The revenue requirement by segment for each rate class is then calculated to maintain, by rate class, the Company's proposed overall ROR used in the initial calculation.

The Direct and Indirect allocators used in the COSS and a detailed review of how all COSS items are segmented and functionalized are discussed in the Appendix G-1 to my testimony. In that Appendix, a description of how each of the major plant categories (gross plant), is segmented or functionalized is provided. The procedures used on Common and General plant, depreciation reserve, adjustments to rate base, operating revenues, O&M expenses for utility plant, administrative and general ("A&G") expenses, depreciation and amortization expenses, *pro forma* expense adjustments, and finally, taxes are also described.

Q. Please describe how the results of the Company COSS are presented in your schedules.

A. Schedule SS-G4 R-1 shows the details of how plant and expense items were separated into each of the five segments and allocated to each category of customers represented by the various rate classifications based upon the extent to which those groups of customers caused the costs. Schedule SS-G4 R-1 also shows the results of the allocation for each plant and expense item to each rate class. Schedule SS-G5 R-1 presents a high-level summary of expenses, plant, and revenue requirements for each of the five functional segments. Schedule SS-G6 R-1 is a summary report of the rate related revenue requirement, by functional segment, for each rate class in total.

The revenue requirements presented in the Company COSS do not include the revenue requirements associated with the SBC or other adjustment clauses or the revenue requirements associated with peaking plant and gas storage facilities. The costs related to the Adjustment Clauses will be collected from customers directly through the appropriate charges, and the revenue requirement associated with the peaking plant or gas storage facilities will be collected directly from the BGSS supplier.

Synchronizing the COSS to the Rate Design

Q. Please explain how the results of the Company COSS were synchronized with the proposed rate design.

A. Two adjustments are made to synchronize the results of the Company COSS to the proposed rate design. The first is an adjustment for the recovery of Rate Schedule TSG-F revenue requirements. The second is to synchronize costs because the COSS test period is different from the period used for the calculation of revenue requirements and rate design. With respect to the recovery of TSG-F revenue requirements, the Stipulation in the Gas Contracts Order, requires that all distribution revenues from Rate TSG-F must flow to the BGSS provider as an offset to BGSS gas costs, not to PSE&G. Thus, although the COSS can be used to determine the revenue requirements associated with Rate Schedule TSG-F, none of the revenue from these customers will flow to PSE&G. Instead, all distribution revenue requirements related to Rate Schedule TSG-F must be recovered from all other firm customers. The calculations to effectuate this requirement are set forth on Page 1 of Schedule SS-G7 R-1 (Cost of Service and Rate Design Sync). As indicated, the TSG-F revenue requirement is re-distributed to Rate Schedules RSG, GSG, LVG and SLG on an equal per therm of BGSS-supplied gas basis. The results of this re-distribution by functional segment are set forth on lines 15 to 20 of Page 1 of Schedule SS-G7 R-1.

In addition, as previously noted, the Company COSS is based on the period of January to December of 2022 while the Rate Design is based on the test year of June 2023 to May 2024. Thus, it is not possible to use the COSS results directly in the rate design process because the number of customers, therms transported, as well as plant and expenses are slightly different between the two time periods. To properly design rates, the COSS results must be adjusted slightly to correspond to the rate design test year period. The methodology used to synchronize the Cost of Service results is set forth on Page 2 of Schedule SS-G7 R-1. Because the primary difference is in the number of customers and amount of gas delivered, each functional segment's revenue requirement from Schedule SS-G6 R-1 was multiplied by the ratio of either the number of customers or gas delivered for the rate design test year to the same value during the COSS test year. The revenue requirements associated with the Distribution Delivery Segment (Row 2) were adjusted by the ratio of the gas delivered in these two periods. The revenue requirements associated with the Access Segment (Row 1), Customer Service Segment (Row 4) and Measurement Segment (Row 5) were adjusted by the ratio of the number of customers in these two periods. The revenue requirements associated with the Street Lighting Segment (Row 3) were adjusted by the ratio of the number of gas streetlights between these two periods. These steps are shown on lines 1 to 15 of page 2 of Schedule SS-G7 R-1. The resulting adjusted Company COSS functionalized revenue requirements are each then adjusted on an equal percentage basis so that the total equals the proposed rate related revenue requirements as set forth on lines 16 to 25 of Page 2 of Schedule SS-G7 R-1. The final adjusted functionalized revenue requirements are used in the rate design process.

<u>RATE DESIGN</u>

Introduction

Q. What are your objectives for developing the proposed gas rates?

A. The proposed gas rates have been developed to meet several objectives. The primary purpose is to recover revenues equal to the revenue requirement from customers. Additionally, this recovery should be effectuated on an equitable basis that provides the correct price signals to individual customers based on the cost to serve those customers. The final objective is that rates should be simple and understandable for the customer.

Q. Are the proposed rates based solely on the results of the Company COSS?

A. No. The COSS is a guide to appropriate ratemaking; its results are not applied in strict mathematical manner to design the proposed rates. While our goal is to move rates toward a full cost basis, that goal must be balanced against the need to achieve reasonable results.

Q. Do the rates included in your testimony include or exclude New Jersey Sales and Use Tax ("SUT")?

A. The proposed rates described in the next sections of my testimony and associated Schedules exclude SUT unless specifically indicated. However, the appropriate prices both without and with SUT are, included in the Proof of Revenue by Rate Schedule in Schedule SS-G11 R-1 as well as the proposed Tariff Sheets set forth in Schedule 3 of Exhibit P-1, and all other schedules that reference rates charged to customers.

Limitations on Rate Changes

Q. Did you develop and apply limits in designing proposed rates in this proceeding?

A. Yes. In order to achieve an overall goal of designing just and reasonable rates, I apply the principle of "gradualism" to temper the rate increases indicated by the Company COSS. To apply the principle of gradualism, I developed and employed a number of limits on the size of the rate increases that are proposed.

Q. Please describe the rate increase limits used in developing the proposed gas rates.

A. The first limit is that the proposed overall percentage revenue increase will be shared, within limits, among all customer classes. Although a primary goal is to move the delivery rates for each rate class toward the cost to serve as indicated by the Company COSS, no class will receive less than 50%, nor more than 150% of the overall average percentage Distribution increase. In addition, no class will receive more than 200% of the overall average percentage bill increase.

These rate increases limits were selected to provide a reasonable balance between the goal of moving towards the cost to serve, and the need to achieve equity among customer classes. The calculation and percentage values of these limits are shown on page 1 of Schedule SS-G8 R-1 (Inter Class Revenue Allocations). For Rates RSG, GSG and LVG, any shortfall in the revenue increase (or decrease) from these limitations was transferred to these other rates based upon the magnitude of the revenue increase (or decrease) received by those rates.

Q. Are there any exceptions to the proposed limits?

A. Yes. Because the prices charged for Rate Schedules TSG-NF and CIG are not cost-based but are based upon other considerations such as value of service, the distribution component for these rates was increased by the overall distribution percentage increase to maintain the current relationship in the level of distribution charges to the level of overall Company gas distribution revenue requirements, with the exception of Rate Schedule CSG. These customers have contracted distribution charges, so only the service charges were increased.

Inter Class Revenue Increase Allocations

Q. Please describe the process for allocating the proposed distribution increase to each rate class.

A. Page 1 of Schedule SS-G8 R-1 shows the calculation of the overall average percentage increase for Distribution and total bills, as well as the calculation of the upper and lower limits to be used in the inter class revenue increase allocation on Schedule SS-G8 R-1, page 2.

Page 2 of Schedule SS-G8 R-1 shows the development of the proposed inter-class allocation of the revenue increase. The Rate Schedules are indicated in Column 1, while Column 2 is the Proposed Distribution Revenue Requirement based upon the Company COSS results that were synchronized to the rate design test year. Column 3 is the Present Distribution Revenue, while Column 4 shows the increase that would occur if the synchronized Company COSS results were used directly, hence the use of the word "Unlimited" in the column heading. Column 5 is the present total bill revenue calculated as if all customers were supplied at BGSS rates. Column 6 is the percentage increase in distribution if the unlimited increase in dollars (from Column 4) were applied to the rates; that is, the percentage increase to each rate schedule if the COSS based increases were applied without constraints. Column 7 is the cost offsets from changes in the Margin Adjustment Clause and the BGSS charges resulting from distribution increases to Rate Schedules TSG-F, TSG-NF, CIG and CSG. The result of the proposed allocation of the Company's revenue requirement increase to the rate classes, consistent with the principles outlined in the previous section, Limitations on Rate Changes, is presented in Column 8 and Column 10. Specifically, Column 8 shows the percentage increase and Column 10 shows the proposed Distribution revenue increase by rate class. Column 9 shows the proposed total bill percentage increase if all customers were supplied at BGSS rates.

Application of these limits is somewhat complex due to the re-distribution of revenue from three sources. Rate Schedule TSG-NF distribution increases are flowed back to customers via the Margin Adjustment Charge (MAC), distribution increases applied to Rate Schedules TSG-F, CIG and CSG flow back to customers as a reduction in their BGSS rates and increases in the rates for gas supplied for pilot use for Rate Schedules TSG-NF and CIG also flow back to firm customers as a reduction in their BGSS rates. All of these credits are as shown in Column 7 of page 2 of Schedule SS-G8 R-1. In order to capture these revenue re-distributions correctly, a strict order of which calculations of the inter-class revenue increase allocations was followed.

The first step was the determination of the cost based charges for Rate Schedule TSG-F (as indicated on line 1 of page 2 of Schedule SS-G8 R-1). Because the value in Column 7 for Rate

Schedule TSG-F, the “Change in MAC and BGSS Credits” is based upon both the final outcome of the Rate Schedule TSG-F increase, as well as that for Rate Schedules TSG-NF and CIG, a value of zero was first utilized for the calculation. Once the upper and lower percentage distribution increase limits were applied (as shown in Column 8), an initial result for the Proposed Total Bill Increase Percentage (Column 9) and Proposed Distribution Revenue Increase (Column 10) was calculated.

The next step was to determine the increases for Rate Schedules TSG-NF and CIG. The Limited Final Distribution Charge Increase Percentage for Rate Schedule TSG-NF (Line 2, Column 8) was set equal to the overall average distribution charge percentage increase (Page 1, Line 8). For Rate Schedule CIG, the overall average distribution charge percentage increase was used as the Limited Final Distribution Charge Increase Percentage for Rate Schedule CIG (Line 3, Column 8).

Once the initial values for the increase to Rate Schedules TSG-NF, TSG-F and CIG were determined, the change in the MAC charge and BGSS credits could be calculated, and then applied to each of the rate schedules affected as indicated in Column 7. The change in the MAC charge used in this schedule relates only to the change in Rate Schedule TSG-NF margins, and does not include a change in the MAC charge due to current over/under recoveries.

The final step was to calculate the proposed distribution revenue increases for Rate Schedules RSG, GSG and LVG. These calculations were done in the same manner as performed for Rate Schedule TSG-F discussed above, although at this stage, the MAC and BGSS credits (in Column 7) had been calculated. These calculations and the application of the limits were performed in an Excel spreadsheet utilizing the “Goal Seek” function in order to meet all of the requirements of the limits and to properly allocate any revenue shortfall between these four rates, while recovering the full requested increase in distribution revenue.

Q. How should the rate design be affected if the Board approves an amount other than the Company's overall revenue increase request?

A. If the Board approves an amount other than the Company's overall revenue increase request, the increase to each of the classes should be allocated in proportion to the proposed revenue increase shown in Column 10, Page 2 of Schedule SS-G8 R-1.

General Rate Design Principles and Methodology

Q. Please describe the general rate design principles and methodology used in developing the proposed gas rates.

A. The rate design methodology presented in this testimony follows the philosophy of the cost allocation methodology used in the Company COSS. The rate design aligns, as close as practical, the rates (prices charged to customers) with the customers' underlying costs.

Changes in the distribution rates for Rate Schedules TSG-F, CIG, CSG and changes in the charges for pilot use for Rate Schedules TSG-NF, and CIG and CSG are cost offsets to the BGSS rates, and the resulting proposed BGSS tariff sheets have been modified appropriately (as indicated in Schedule 5 of the transmittal letter and in Schedule SS-G12 R-1).

The Service Charges for Rate Schedules RSG, GSG, LVG and TSG-F were set to move towards the revenue requirements indicated in the Company COSS for the sum of the Access, Customer Service, and Measurement segments. Except for the Residential Service Gas (RSG) Rate Class, which is discussed in the rate class specific changes portion of my testimony, the change in the Service Charges was limited to the same general inter rate class limits of no more than 150% of the overall average Distribution percentage increase. The proposed Service Charges on Rate Schedules TSG-NF and CSG were set equal to the Service Charge on Rate Schedule TSG-

F and the Service Charge for Rate Schedule CIG was increased in an amount equal to the overall average distribution percentage increase.

These limits were selected to provide a reasonable balance between the goal of moving each rate component towards costs, and the goal of achieving reasonable bill impacts. Any shortfall in Service Charge revenue resulting from these limitations was transferred to the remaining Distribution Charges of each rate schedule. In general, the Distribution Charges for each Rate Schedule were set to recover all the revenue requirements of the Distribution Delivery segment, plus any shortfall created from limitations in the proposed Service Charges. The calculations of the proposed Service Charges are found on Schedule SS-G10 R-1.

RATE SCHEDULE SPECIFIC CHANGES

Rate Schedule Residential Service Gas ("RSG")

Q. Please describe the rate design for Rate Schedule RSG.

A. Currently, Rate Schedule RSG is below its cost to serve. In addition, as indicated in Schedule SS-G9 R-1 Service Charge Calculations, (line 2), the Company COSS indicates that an increase in the monthly Service Charge is warranted, while the current Distribution Charge per Therm is above cost. Therefore, the Company proposes to increase the service charge corresponding to Service Charge limits discussed earlier. This will ensure that the Service Charge and Distribution Charge per Therm rate, will continue to move closer to the cost to serve.

The Distribution Charge for the Special Provision for Off-Peak use has been set at one-half the normal Distribution Charge. This is a continuation of the practice to provide a reasonable balance between providing the correct price signals to customers with gas air conditioning, while providing some contribution to offset winter peak period costs (and thus rates). No changes are proposed for qualification for this Off-Peak provision.

The results of the Rate Schedule RSG rate design appear on page 5 of the Proof of Revenue in Schedule SS-G11 R-1. The general format of the calculations is described on the first page of that Schedule. The calculation of the annual gas commodity cost utilized in the Proof of Revenues for this and all other rate schedules is based upon all customers purchasing gas on the appropriate BGSS service as presented in Schedule SS-G10 R-1. The magnitude of the BGSS values remain constant in both sides in the Proof of Revenue (Schedule SS-G11 R-1) and their inclusion allows the proposed rate changes to be viewed in the context of a customer's overall bill.

The calculation for the changes in the MAC clause resulting from the change in flow back from the TSG-NF rates is included in Schedule SS-G8 R-1. Typical residential customer bill impacts as a result of these changes are shown on page 1 and 2 of Schedule SS-G12 R-1.

Rate Schedule General Service Gas ("GSG")

Q. Please describe the rate design for Rate Schedule GSG.

A. The Service Charge was set to move towards the Company COSS results to recover the revenue requirements for the Access, Customer Service and Measurement segments utilizing the previously discussed limits as shown in Schedule SS-G9 R-1.

The Distribution Charge was set utilizing the balance of the Proposed GSG Distribution Revenue Increase from Schedule SS-G8 R-1.

As with Rate Schedule RSG, the Distribution Charge for the Special Provision for Off-Peak use has continued to be set at one-half of the normal Distribution Charge. This continues the practice of providing a reasonable balance between providing the correct price signals to customers with gas air conditioning, while providing some contribution to offset winter peak period costs (and thus rates). No changes are proposed for qualification for this Off-Peak provision.

The results of the Rate Schedule GSG rate design are shown on page 7 of Schedule SS-G11 R-1. The general format of the calculations is described on the first page of that Schedule. The typical customer bill impacts as a result of these changes are shown on page 3 and 4 of Schedule SS-G12 R-1.

Rate Schedule Large Volume Gas ("LVG")

Q. Please describe the rate design for Rate Schedule LVG.

A. Similar to what was done for Rate Schedule GSG, the LVG Service Charge was set to move towards the Company COSS results to recover the revenue requirements for the Access, Customer Service and Measurement segments utilizing the previously discussed limits as shown in Schedule SS-G9 R-1.

The Distribution Charges and Demand Charge were set to recover the balance of the revenue requirements. As I have previously discussed, the majority of gas distribution related costs are relatively fixed, and do not vary with the monthly volumes of gas transported.

In order to meet the rate design goals outlined at the start of this Section of my testimony, and to prevent unintended customer migration between Rate Schedules GSG and LVG, the Rate Schedule LVG rate maintains the existing rate design principle that a bill for a 12,000 therm per year customer be approximately the same for Rate Schedules GSG and LVG. With this in mind, the demand charge was set to recover the same percentage of the distribution revenue as currently. The block one and block two charges were then calculated to uniquely recover the balance of the Rate Schedule LVG revenue requirements and maintain LVG/GSG bill neutrality at 12,000 therms per year, distributed on the monthly usage pattern of the average GSG customer.

The results of the Rate Schedule LVG rate design are shown on page 9 of Schedule SS-G11 R-1. The general format of the calculations is described on the first page of that Schedule.

Information on the typical customer bill impacts as a result of these changes is indicated on page 5 and 6 of Schedule SS-G12 R-1.

Rate Schedule Street Lighting Gas ("SLG")

Q. Please describe the rate design for Rate Schedule SLG.

A. The Company proposes to increase the Distribution Charge per Therm to its cost to serve as determined by the COSS.

The balance of the revenue requirements will be recovered from the luminaire charge, and the prices for individual gas streetlights will be updated but limited by the overall rate impact limitations I have previously discussed.

The results of the Rate Schedule SLG rate design are shown on page 13 of Schedule SS-G11 R-1. The general format of the calculations is described on the first page of that Schedule.

Rate Schedule Transportation Service Gas – Firm ("TSG-F")

Q. Please describe the rate design for Rate Schedule TSG-F.

A. This rate remains closed except to existing customers. The Service Charge was set to move towards the Company COSS results to recover the revenue requirements for the Access, Customer Service and Measurement segments while applying the previously discussed limits as shown in Schedule SS-G9 R-1. The balance of the revenue increase is proposed to be recovered proportionally from the volumetric Distribution Charge and the Demand Charge. The results of the Rate Schedule TSG-F rate design are shown on page 15 of Schedule SS-G11 R-1. The general format of the calculations is described on the first page of that Schedule.

Rate Schedule Transportation Service Gas – Non Firm ("TSG-NF")

Q. Please describe the rate design for Rate Schedule TSG-NF.

A. The Service Charge for TSG-NF has been set equal to the new Service Charge proposed for Rate TSG-F, the calculation of which is shown on Schedule SS-G9 R-1. The charge for gas used for pilots during an interruption is proposed to be increased, based on the highest monthly price for gas service on Rate Schedule GSG, including balancing charges and gas supply service on BGSS-F, that occurred in the prior 36 month period.

Special Provision (a) has been modified to add penalty language if a customer does not provide an alternative fuel capability affidavit by November 1st.

The results of the Rate Schedule TSG-NF rate design are shown on page 17 of Schedule SS-G11 R-1. The general format of the calculations is described on the first page of that Schedule.

Rate Schedule Co-Generation Industrial Gas ("CIG")

Q. Please describe the rate design for Rate Schedule CIG.

A. This rate remains closed except to existing customers. Because the Service Charge was never based on cost, it was increased by the overall average Distribution percentage increase.

The Company proposes to modify the margin component of the rate so that the net of all of the adjustments to the Estimated Average Commodity Cost per therm that are used to determine the price paid by customers is increased by the overall average Distribution percentage increase. The differential charge for the two usage blocks of Rate Schedule CIG, usage less than 600,000 therms per month and usage in excess of this amount, has been kept at the same one cent per therm differential that currently exists.

The results of the rate design are shown on page 11 of Schedule SS-G11 R-1. The general format of the calculations is described on the first page of that Schedule.

Rate Schedule Contract Service Gas ("CSG")

Q. Please describe the rate design for Rate Schedule CSG.

A. The Service Charge for CSG has been set equal to the new Service Charge proposed for Rate TSG-F, the calculation of which is shown on Schedule SS-G9 R-1. Because the distribution charge for CSG customers is not based on cost the majority of customers on this rate class will receive no change in their per therm distribution rate with the exception of those that are contracted to have their charges adjusted during base rate proceedings.

<u>TARIFF CHANGES</u>

Q. Are you proposing any further changes to the proposed tariff?

A. Yes. Please refer to the Guide to Gas Tariff Changes, Exhibit P-1 Schedule 4.

<u>TAX ADJUSTMENT CREDIT ("TAC")</u>

Q. Please briefly describe the TAC Mechanism.

A. The TAC mechanism was established in the 2018 Rate Case Order, to flow back certain tax benefits to customers.

Q. Please briefly describe PSE&G's proposed TAC adjustments.

A. As described in more detail in the testimony of Mr. Pardo, the Company is proposing the following adjustments to the TAC:

1) In addition to continuing to flow back the benefit of the historic Safe Harbor Adjusted Repair Expense ("SHARE") deduction, the Company proposes to flow back to customers the net federal tax benefit associated with the historical Mixed Service accumulated deferred income taxes ("ADIT") balance over approximately five years.
2) The Company proposes to add the current Mixed Service deduction net benefit to the current SHARE deduction net benefit already included in the TAC, but both at a pre-

determined, fixed annual amount, with any excess to be flowed back to customers in a subsequent rate case; and

3) To better match the seasonal flow of Company pre-tax income, the Company began to amortize the monthly flow back of excess deferred income taxes ("EDIT") and SHARE on a seasonal basis in the 2023 TAC filing to match pre-tax income as described in the 2023 TAC cost recovery proceeding. In this proceeding, the Company is aligning the return calculation with the seasonal amortization methodology.

4) To anticipate additional guidance along with proposed and final regulations on the Inflation Reduction Act's newly enacted 15% corporate alternative minimum tax ("CAMT") and material changes to energy tax credit law, the Company may propose an adjustment to the TAC or other mechanism to capture the impact of further U.S. Treasury guidance on the CAMT, if such guidance is applicable to PSE&G. Any proposed amortizations would be included in columns 17-20 in worksheet 'RevReq-G' of WP-SS-TAC-1.xlsx.

Q. Does the Company have an amortization schedule for the proposed amortizations?

A. Yes, the proposed amortizations are included in summary format in rows 167-170 in worksheet 'RevReq-G' of WP-SS-TAC-1.xlsx for 2025 through 2028.

Q. How does the Company propose to modify the TAC revenue requirement formula based upon the changes discussed previously?

A. The TAC revenue requirement formula is calculated monthly and will be modified with the ***bolded items*** below:

TAC Revenue Requirement = (Amortization of Protected ADIT Balance +(Amortization of Historic SHARE ADIT) Balance + ***(Amortization of Historic MSC Deduction ADIT Balance*** *+ After-tax Return on Cumulative Historic SHARE Deduction ADIT Change +* ***After-tax Return on Cumulative Historic MSC***

Deduction ADIT Change *+* ***Pre-set*** *SHARE Deduction Flow-Through +* ***Pre-Set MSC Deduction Flow-Through*** *+ IRS Audit Electric Adjustments + Other Major Gas Tax Adjustments) + (****Amortization of CAMT*** *+ After-tax Return on CAMT)* Gas Revenue Factor*

See Schedule SS-TAC-2G R-1 for the monthly net revenue requirement calculations.

Q. What is the TAC amount for the initial period after base rates are projected to take effect in this proceeding?

A. The gas net revenue requirement for the initial 16-month period of September 1, 2024 through December 31, 2025 is a credit to gas customers of $250.9 million or $197.0 million on an annualized basis. See Schedule SS-TAC-1 R-1.

DISTRIBUTION ADJUSTMENT CHARGE AND STORM RECOVERY CHARGE ("SRC")

SRC Mechanism

Q. Please briefly describe the Company's proposed SRC.

A. As described in the testimony of Mr. McFadden, the Company is proposing a SRC to:

1. Recover the deferred major storm costs that have been incurred since 2018 with interest.
2. Defer and then recover future major storm costs, including interest, through subsequent true-up filings.

Q. Please describe the methodology used to calculate the SRC recovery.

A. The Company is proposing a new Distribution Adjustment Charge ("DAC") clause in its gas tariff with the SRC as a new component of the DAC. The DAC was proposed by the Company in its COVID-19 cost recovery filing where COVID-19 Recovery Charge would also be a component of the DAC. The details of the SRC and the recovery mechanism are described below. The following formula describes the SRC mechanism:

SRC Balance = Prior Month SRC Balance – SRC Revenue + Incremental Deferred Major Storm Costs + Interest Expense

Q. How will the SRC be charged or refunded to customers?

A. The Company proposes to charge or refund the SRC through a new component of the Company's proposed DAC in the Company's gas tariff. The charges will be applied to each therm of a customer's usage and will apply to all gas customers.

SRC Components

Q. What is the Initial SRC Balance?

A. The Initial SRC Balance is the total incremental deferred major storm costs associated with major storms since the Company's last Base Rate Case in 2018 prior to the implementation of the SRC rate.

Q. What are the "Incremental Deferred Major Storm Expenses?"

A. The Incremental Deferred Major Storm Costs are those monthly costs that occur after the implementation of the SRC rate.

Q. What is the "Interest Expense?"

A. The Interest Expense is the monthly carrying costs related to the SRC Balance. It is calculated as following ((Prior Month SRC Balance + (– SRC Revenue + Monthly Activity + Prior Month SRC Balance)) / 2) x (Annual Interest Rate / 12). In calculating the Interest Expense, the annual interest rate is based upon the Company's interest rate obtained on its commercial paper and/or bank credit lines utilized in the preceding month. If both commercial paper and bank credit lines have been utilized, the weighted average of both sources of capital shall be used. In the event that neither commercial paper nor bank credit lines were utilized in the preceding month, the last calculated rate will be used. The interest rate shall not exceed PSE&G's overall rate of return as authorized by the Board as utilized in calculating revenue requirements for the corresponding period. The calculation of the monthly interest can be found in Schedule SS-SRC-1G R-1, Page 1.

Q. How does the Company propose to calculate the initial SRC Rate?

A. The Company proposes to set the initial SRC Rate to recover these costs over a three- year period including interest. The rate will be a rate applied to all gas customers where applicable. See Schedule SS-SRC-1G R-1, Page 2 for the calculation.

Q. When does the Company propose to submit subsequent SRC filings to change the SRC?

A. The Company plans to submit a periodic SRC filing to change the SRC rate if warranted based upon the projected SRC over/under balance.

Q. When will storm costs be reviewed for prudency?

A. The Company proposes that all storm costs will be reviewed as part of subsequent SRC filings.

Q. When is the initial implementation of the SRC anticipated to occur?

A. The SRC is proposed to be effective September 1, 2024 corresponding to the change in base rates as a result of this proceeding. If the Board approves new base rates earlier or later than September 1, 2024, the initial rate period and corresponding rate will be adjusted accordingly from the effective date of the Board Order.

Q. What is the SRC amount for the initial period after base rates are projected to take effect in this proceeding?

A. The gas net revenue requirement for the initial annual period of September 1, 2024 through August 31, 2025 is a charge to gas customers of $1.3 million. See Schedule SS-SRC-1G R-1.

<u>GAS BAD DEBT RECOVERED VIA THE SBC</u>

Q. Is the Company proposing to change the recovery method of gas bad debt expenses currently recovered from customers?

A. Yes. As described in the testimony of Mr. McFadden, the Company is proposing to change the recovery method of its gas bad debt expenses.

Q. What is PSE&G's proposal in this proceeding?

A. Consistent with my testimony in the COVID-19 proceeding, the Company proposes that gas bad debt expenses be recovered through a new Social Programs component of the Gas SBC, consistent with the recovery of electric bad debt expense via the Social Programs component of the Electric SBC.

Q. Please describe the calculation method of Social Programs component of the Gas SBC and how it will be collected from customers?

A. The proposed Social Programs component of the Gas SBC will be calculated in a manner almost identical to the Social Programs component of the Company's Electric SBC. Schedule SS-SBC-1 R-1 contains the proposed rate calculation that will be effective concurrent with the effective date of the proposed base rates. This rate will be applicable to gas customers who currently pay the Gas SBC. Schedule SS-SBC-2 R-1 calculates the Over / (Under) Balances based upon the monthly revenue collected and gas bad debt expense. Interest calculated on the accumulated balance will be calculated identical to the method used to calculate interest for the Social Programs component of the Electric SBC, calculated monthly and added to the accumulated balance at end of each rate period. The interest rate will used will be the 2-year Treasury Bill rate plus 60 basis points, updated every August 1st each year. Schedule SS-SBC-3 R-1 calculates the annual forecasted revenue by rate schedule for the initial period commencing with the implementation of the proposed base rates.

STAFF COSS METHODOLOGY

Q. Please explain why you are submitting the Staff COSS.

A. As part of the 2018 Rate Case Order, the Company agreed to perform a COSS in the manner prescribed by Staff in the Company's next rate case. The Staff COSS and the summary of the resulting functional revenue requirements by rate class has been submitted herein with the Company's current proposed rate case filing.

Specifically, Schedule SS-G13 R-1 contains the Details of the complete Staff COSS, Schedule SS-G14 R-1 is the Summary Report by Functional Segment based on Staff's Method, and Schedule SS-G15 R-1 is the Functional Cost Summary of the COSS results based on Staff's Method.

In the Stipulation that resolved the 2018 Rate Case, the parties made it clear that they were not agreeing that the Staff COSS was appropriate, was consistent with cost causation principles, or would be a useful guide in determining just and reasonable rates. Specifically, the Stipulation stated (at 11-12):

> All parties will be free to submit any number of alternative cost of service methodologies for the Board's consideration in future cases. The Company and any Signatory to this agreement will have the right to file and support any COSS method it considers appropriate.[5]

Q. Does the Company believe that the Staff COSS provides a reasonable foundation for establishing just and reasonable rates in this proceeding?

A. No. The Staff COSS Methodology is not an appropriate methodology to use to establish just and reasonable rates because it does not achieve a result that is tied to cost causation. Instead, the Staff COSS goes to extraordinary and convoluted lengths to allocate and functionalize costs away from residential customers and onto the shoulders of commercial and industrial customers.

[5] 2018 Rate Case Order at Stipulation ¶ 25.

While it may be reasonable to moderate the level of increase to be borne by residential customers, the vehicle for doing so should not be an COSS that arbitrarily transfers costs to businesses operating in the Company's service territory. The Company has taken reasonable steps to moderate the level of increase in rates for Rate Schedules RSG and GSG customers with its gradualism-based recommendations that limit the amount of increases for those classes.

The "Average and Excess" methodology underlying the Staff COSS has existed for many years. Historically this method was used to allocate costs of electric generation plant and gas production facilities where, arguably, there is an energy investment component beyond that necessary to provide capacity at the time of peak load. However, there is no evidence that costs for Public Service's gas distribution service business are caused for such reasons. It is beyond dispute that the Company's existing design criteria is based solely on peak demand. Thus, the Staff COSS has no relationship to actual distribution plant costs or operations. As testified to by Mr. Schmid in this case, the distribution planners and designers plan and install facilities to meet the peak demands of customers – not based on the amount of energy (in therms) they consume.

The fundamental error in the Staff COSS is that there is no relationship at all between the amount of gas a pipe can carry, its diameter, and any split between a demand and energy cost classification. Determining an energy/peak classification based on the physical nature of natural gas and the pipe it flows within is unrelated to determining the cost of providing gas distribution service. Just because equipment such as gas main delivers energy, such as a gas main, it should not be classified as energy-related unless the amount of energy, other than peak energy, had some basis in the design. Gas mains have been, and continue to be, installed to bring gas service to the proximity of each customer's premise and are sized to handle the peak hourly gas flow at design conditions, without regard to the gas flow at any other time of day or season. These are the sole reasons and engineering basis for their design and cost, and as such, the allocation of these costs should properly reflect each rate class's responsibility for the peak gas flow.

Subsequent Base Case Requirements

Q. Do you believe that the Company should be required to complete the Staff COSS in subsequent base rate case filings?

A. No. The Company is requesting that this requirement not be included for the filing of its next base rate case.

Q. Does this conclude your direct testimony?

A. Yes. It does.

APPENDIX G-1 - DETAILED REVIEW OF COST OF SERVICE STUDY

Schedule SS-G4 R-1 shows the details of the Cost of Service Study used to develop distribution revenue requirements by rate schedule. This study was used in the development of the proposed rates and the following discussion is limited to this analysis. These results are summarized by revenue requirements for each rate schedule and by segment in Schedule SS-G6 R-1.

The study, as previously mentioned, is based on weather normalized costs and billing determinants for the 12 month period ending December 31, 2022, and is limited to the gas delivery business.

ALLOCATOR NAMING CONVENTION

For consistency and simplicity of bookkeeping, a naming convention has been developed for the modeling allocators.

Direct Allocators

All modeling allocators that end in a dash and a number (such as "PEAKHOUR-03") are direct allocators, meaning that:

1. The word portion of the direct allocator denotes the types of external constant or value used to allocate the plant or expense item as indicated by the name of the modeling allocator. For example, the "PEAKHOUR" denotes the Coincident Peak Hour demand of the entire system observed at the City Gate, and
2. The number portion of the direct allocator denotes the segment to which the plant or expense item is functionalized. For example, the "03" in "PEAKHOUR-03" denotes segment number 3. The business segment numbering method used in our analysis is as follows:

Segment #2 - Distribution Access

Segment #3 - Distribution Delivery

Segment #4 – Street Lighting Fixtures

Segment #5 - Customer Service

Segment #6 - Measurement

Note that labels for Segments #1 is not used.

Indirect Allocators

All modeling allocators that do not end in a dash and a number (such as A&GEXP) are indirect allocators, meaning that they will both segment and allocate costs in the same proportion as other individual or group of plant or expense items. The names of these modeling allocators are an indication of the basis upon which this allocation and functionalization process takes place.

ALLOCATION DETAILS

Intangible Plant

Gas intangible plant (Accounts G301 to G303) was not included in the study

Production Plant

All production plant (Accounts G304 to G320 on Schedule SS-G4 R-1, page 4, line 26) was determined to be related to wholesale balancing services and thus segmented to the Distribution Delivery segment and allocated on the basis of the total balancing therms for each rate schedule. This allocator (BALANCE-04) is the same allocator used throughout the Cost of Service model for all production plant assets and expenses, as well as the revenue received from the BGSS Supplier for the operation of these facilities.

Storage Plant

Storage plant (Schedule SS-G4 R-1, page 4, line 30 to 33) is treated in the same manner as production plant because it relates to balancing services. Therefore, Storage plant is segmented to Distribution Delivery and allocated on the basis of balancing therms.

Transmission Plant

All of transmission plant (Accounts G365 to G369 on Schedule SS-G4 R-1, page 4, lines 35 to 40) was determined to be related to the Distribution Delivery segment. A majority of this plant is for large gas pipes (transmission mains), which are classified as transmission mains rather than distribution mains in accordance with federal and state regulations generally due to the high operating pressure and larger size. Since these facilities perform the same type of function as distribution mains, the plant has been treated in an identical manner to that of distribution mains and allocated to the rates based upon each class's share of the amount of gas transported at the system design peak hour.

Distribution Plant

In the regulated gas distribution business determining cost causation for the revenue requirements related to gas mains and to gas services is one of the most important issues because together these facilities comprise the vast majority of rate base and are the basis for much of the operations and maintenance expenses. The majority of Distribution Plant (Accounts G374 to G388 as shown on Schedule SS-G4 R-1, page 5, line 46, to page 6, line 119) has been functionalized to four primary segments – Distribution Delivery, Distribution Access, Street Lighting Fixtures and Measurement. The plant related to Land and Structures (Accounts G374 and G375) is related to local Distribution operations field offices, and was functionalized and allocated in the same proportion as

Distribution plant in total. Gas mains have been functionalized to the Distribution Delivery segment, gas services and house regulators to the Distribution Access segment, meters to the Measurement segment, and all gas street lighting related equipment to the Street Lighting Fixtures segment.

After the functionalization was completed, each account was then examined to determine the proper allocation across rate classes. Investment for Gas Services (G380), Gas Meters (G381, G382, G385), and House Regulators (G383, G384) was then allocated to Rate Schedules RSG, GSG and LVG. This was based upon a study of actual customer installations and using the results as the basis for determining the relative investment for all customers. For the reasons that I have previously discussed, the investment for Gas Mains (Account G376) was allocated to all classes on the basis of each class's share of the amount of gas transported at the system design peak hour.

The investment in Compressor Station Equipment (Account G377) is generally determined to be related to the natural gas refueling stations located at several Public Service locations that are utilized to fuel the natural gas cars and trucks used by the Company. Any costs in this account shall be segmented to Distribution Delivery and allocated in the same manner as total Distribution Plant other than meters. All Street Lighting Facilities (G387) including the services, posts, and heads were directly assigned to Rate SLG.

Other Distribution Plant

The plant associated with Asset Retirement Obligations (booked in Account G388) relates almost exclusively to gas mains, and therefore was functionalized and allocated in the same proportion as gas mains.

General, Common and Other Plant

An accounting code, or Business Code, associated with the actual gross plant balances indicating the department to which the plant is assigned was used to segment both the general (Accounts G389 to G399) and common (Accounts C303, and C389 to C399) plant account items (Schedule SS-G4 R-1, page 4 for C303 and page 7 for general and common). Each Business Code was then grouped by function to be allocated based on cost causation. For example; a Description for office furniture and equipment was added to the Customer Service segment and allocated in the same proportion as all Customer Service activities. In other cases, where some of the facilities, such as vehicles, etc. used by the Customer Operations Department are shared between groups that are responsible for meter reading and those that provide general customer service (collections, phone inquiry, walk-in payment centers, etc.), these investments were further split in the Cost of Service Study between the Measurement segment and the Customer Service segment based on the proportion of work performed by each group. In general, all general and common investments were allocated to the rate schedules in the same proportion as the overall respective plant accounts for each segment. Items for which no reasonable functionalization could be determined were classified as "unassigned" and allocated in the same proportion as its associated plant account. In other words, unassigned general plant followed general plant and unassigned common plant followed common plant (general plant is shown on Schedule SS-G4 R-1, page 7 line 94 to line 102; while common plant is on Schedule SS-G4 R-1, page 7 line 105 to line 112).

Depreciation Reserve

The depreciation reserve associated with Accounts G300 to G399 was segmented and allocated in the same proportion as its associated plant account (Schedule SS-G4 R-1, page 8, line 1 to page 10, line 114).

Adjustments to Develop Rate Base

Adjustments to net plant used to develop Rate Base consist primarily of working capital and deferred taxes for the distribution utility. The underlying components of working capital were analyzed and segmented according to their individual use. Working capital requirements associated with Material and Supplies were allocated and segmented in proportion to the total plant, other than General and Common. Working capital requirements associated with Cash and Prepayments & Working Funds were allocated and segmented in the same proportion as the total of O&M and capital additions (essentially cash outlays) through the use of the allocator termed "EXPENDITURES". Deferred taxes were segmented and allocated in proportion to the related plant values. These adjustments are indicated in Schedule SS-G4 R-1, page 11, lines 1 to 37.

Operating Revenues

The values indicated in Schedule SS-G4 R-1, page 2, line 52 entitled "Rate Revenues from Customers" are the portion of the total target balanced revenue requirements that are necessary to be recovered from rate-related revenues (from service charges, distribution charges, minimum charges, etc.) at the proposed overall ROR, plus the increases in non rate-related revenues.

The effects of other non-rate-related revenues are booked to Accounts G487 to G495 and are shown in Schedule SS-G4 R-1, page 12, lines 9 to 19. The primary sources of these other revenues, booked in Account G488, are Competitive Services. These services have been segmented to the Distribution Delivery segment and allocated back to the customer rates from which the revenue was received, and Peaking Services (revenue from the BGSS Supplier for the operation of the peaking facilities), which constitutes the majority of the revenue booked in Account G495 and is segmented to Distribution Delivery and allocated based on balancing therms.

Production Expenses

Similar to the production plant items, all production expenses (Accounts G710 to G745 on Schedule SS-G4 R-1, page 13, lines 4 to 6) relate to wholesale balancing services and are segmented to Distribution Delivery and allocated on the basis of balancing therms, consistent with the methodology used for Production Plant.

Gas Supply Expenses

Although booked to Other Gas Supply Expenses - Account G813, any costs charged herein, relate to the operation of the Gas Systems Operations Center (GSOC) and thus are related to gas dispatching. Therefore, any costs in this Account shall be segmented to the Delivery segment and allocated on the basis of total therms delivered. This is shown on Schedule SS-G4 R-1, page 13, line 18.

Other Storage Expenses

The costs associated with the operation and maintenance of Company owned storage facilities (Account G840-G843 on Schedule SS-G4 R-1, page 13, lines 22 to 25) are treated in the same manner as production plant and segmented to Distribution Delivery and allocated on the basis of balancing therms.

Transmission and Distribution O&M Expenses

O&M expenses for transmission and distribution (Accounts G850 to G894 on Schedule SS-G4 R-1, page 13, line 28 to page 14, line 68) were generally segmented and allocated in the same proportion as their associated plant account(s) with the exception of Customer Installations expense (Account G879) which was allocated to the rates based upon an analysis of the customers for which that work was performed.

Customer Accounts, Service and Sales Expense

Expenses from a wide range of customer contact activities are booked to Accounts G901 to G916. A separate analysis was performed on the costs charged to each of these accounts to determine the best functionalization fit. The details of this account-by-account functionalization can be found on Schedule SS-G4 R-1, page 14, line 73 to page 15, line 108. The costs in each of these accounts related to meter reading were segmented to the Measurement segment and allocated on the basis of the costs to read meters for each rate class; the portion related to billing was segmented to the Customer Service segment and allocated on the relative costs of billing by rate class; the portion related to account maintenance activities (including answering general questions, setting up new accounts, remittance processing, and collection activities) was segmented to the Customer Service segment and allocated on the relative costs of performing these activities by rate class; and the portion of these expenses related to general regulated utility responsibilities was segmented to the Distribution Delivery segment and allocated on the relative costs of performing these activities by rate class. The portion of Customer Records and Collection costs (Account G903 and G905) associated with costs to disconnect customers for non-payment of bills (and their eventual reconnection) were segmented to the Customer Service segment and allocated based upon the number of customers.

Energy Efficiency and Renewable Energy expenses, a component of the SBC, normally recorded in Account G908 were not included in this analysis as discussed earlier in this testimony and as indicated on page 1 of Schedule SS-G3 R-1.

Administrative and General (A&G) Expenses

Administrative and General Expenses (Accounts G920-935) include a mix of expenditures, which were analyzed separately to determine the best functionalization fit. The details of this item-by-item functionalization can be found on Schedule SS-G4 R-1, page 15, lines 115 to 132.

An adjustment was made to the A&G expenses for G923 and G926 to separate those costs associated with the Gas Peaking Plants and to segment them to the Distribution Delivery segment. These costs were then allocated on the basis of balancing therms, similar to the method applied to other gas production related investment and expenses.

Depreciation and Amortization Expenses

All depreciation and amortization expenses were segmented and allocated in the same proportion as their associated plant accounts (Schedule SS-G4 R-1, page 17, lines 1 to 27).

Taxes Other Than Income Taxes

Other non-income type taxes were allocated based on their relationship to other plant and expenses, as indicated on Schedule SS-G4 R-1, page 18, lines 4 to 12.

Pro Forma Expense Adjustments

The pro forma adjustments the Company is proposing are summarized in Schedule MPM-29 R-1 and detailed as Adjustments #1 to #24 in Schedules MPM-30 R-1 through MPM-53 R-1 of Mr. McFaddens' direct testimony in this proceeding. Those adjustments are included in this section of the Cost of Service Study on Schedule SS-G4 R-1, page 18, lines 16 to page 19 lines 57, with the exception of the pro forma adjustments discussed below.

One specific adjustment, Pro Forma Adjustment #11 Schedule MPM-29 R-1 adjusts revenue related to the switching between Rate Schedules TSG-NF and LVG. The Company currently retains a portion of the margins from gas service to new TSG-NF customers that commenced after the Company's base rate cases in 2001 and 2005, in accordance with the Settlements and Board Orders in Docket Nos. GR01050297 and GR05100845. Also, the Company retains the margins (total revenue less commodity revenue, SUT, SBC, and GPRC) from customers who switch from Rate Schedule LVG to TSG-NF. Conversely, the margins from customers who switch from TSG-NF to LVG are credited to the Margin Adjustment Charge (MAC) in lieu of being retained by the Company. The balance of the margin is credited to the MAC. These retained amounts are reset to zero in each succeeding base rate case. Therefore, this adjustment decreased operating income in the amount of $764,221.

Each pro forma adjustment included in the Cost of Service Study was segmented and allocated in the same proportion as the associated plant or O&M account(s). The Cost of Service modeling of Pro Forma #3 associated with Interest Synchronization, Pro Forma #5 associated with Gas COLI Interest Expense, and Pro Forma #7 associated with Gains and Losses on Sales of Property all include the added tax effects on revenue requirements as an additional expense. Those pro forma adjustments excluded from the Cost of Service Study are as follows:

- Adjustment #6- Weather Normalization Adjustment (Schedule MPM-29 R-1) is a weather normalization of operating revenues. The Cost of Service Study is already based on weather normalized costs and usage, and no further adjustment is required.
- Adjustment #11 – TSG-NF Margin Sharing (Schedule MPM-29 R-1) is related to the elimination of margin sharing revenue associated with capital investment made for TSG-NF customers since the last base case. Because these investments are already included in the proposed Rate Base, the revenue requirements related to these investments are already included in the Cost of Service Study.

Taxes

All Taxes and Tax Deductions were segmented and allocated in the same proportion as their associated plant or O&M account(s). Details of these allocations are indicated from pages 20-25 of Schedule SS-G4 R-1.

CREDENTIALS
OF
STEPHEN SWETZ
SR. DIRECTOR-CORPORATE RATES AND REVENUE REQUIREMENTS

My name is Stephen Swetz and I am employed by PSEG Services Corporation. I am the Sr. Director - Corporate Rates and Revenue Requirements where my main responsibility is to contribute to the development and implementation of electric and gas rates for Public Service Electric and Gas Company (PSE&G, the Company).

WORK EXPERIENCE

I have over 30 years of experience in Rates, Financial Analysis and Operations for three Fortune 500 companies. Since 1991, I have worked in various positions within PSEG. I have spent most of my career contributing to the development and implementation of PSE&G electric and gas rates, revenue requirements, pricing and corporate planning with over 20 years of direct experience in Northeastern retail and wholesale electric and gas markets.

As Sr. Director of the Corporate Rates and Revenue Requirements department, I have submitted pre-filed direct cost recovery testimony as well as oral testimony to the New Jersey Board of Public Utilities and the New Jersey Office of Administrative Law for base rate cases, as well as a number of clauses including infrastructure investments, renewable energy, and energy efficiency programs. A list of my prior testimonies can be found on pages 3 and 4 of this document. I have also contributed to other filings including unbundling electric rates and Off-Tariff Rate Agreements. I have had a leadership role in various economic analyses, asset valuations, rate design, pricing efforts and cost of service studies.

I am an active member of the American Gas Association's Rate and Strategic Issues Committee, the Edison Electric Institute's Rates and Regulatory Affairs Committee and the New Jersey Utility Association (NJUA) Finance and Regulatory Committee.

EDUCATIONAL BACKGROUND

I hold a B.S. in Mechanical Engineering from Worcester Polytechnic Institute and an MBA from Fairleigh Dickinson University.

BGSS-RSG "Weather Normalized All" - used tariff rates with out SUT (effective 6/1/2023 the rate was $0.442408; and effective as of 10/1/2023 the rate is $0.372799).
BGSS-RSG excludes Off-Peak volume because it has its own specific BGSS-RSGOP rate (effective as of 5/1/2023 the rate is $0.279082). Applicable May - October only.
BGSS-RSG does not include any BGSS-RSG Bill Credits.
GSG includes Off-Peak usage.
All BGSS rates (BGSS-Firm, BGSS-Interruptible, BGSS-CIG) are monthly changing rates and are based on the most current Tariff rates applicable for that month.
All BGSS rates exclude SUT.

Gas Proof of Revenue by Rate Schedule

Narrative for Rate Schedule Design

The summary and each rate schedule provide the details of 1) a) Actual and b) Weather Normalized and also 2) a) Annualized Weather Normalized (all customers assumed to be on BGSS and revenue based on current tariff rates), b) the Proposed rate design.

1) Actual and Weather Normalized

All the components are separated into Delivery and Supply. In addition to the Distribution components of Delivery, also included in the schedule are lines for Balancing Charge, Societal Benefits Charge, Margin Adjustment Charge, Gas Conservation Incentive Program, Green Programs Recovery Charge, Tax Adjustment Credit, Facilities Charge, Minimum Charge, Miscellaneous items, and Unbilled Revenue. The first column shows the actual billing units for the test year from Schedule SS-G2. The second column shows annual average rates (without Sales and Use Tax, SUT) occurring during the test period. The commodity rates in the second column reflect class-weighted averages for the test year from SS-G11. The third column presents annualized revenue for the test period. The fourth column shows the weather normalized billing units for the test year from SS-G2. The fifth column shows the applicable rates. Column six (6) presents weather normalized revenue. Columns seven (7) and eight (8) show the differential revenue, in thousands of dollars and percent increase, respectively, for each of the billing unit blocks.

2) Annualized Weather Normalized (all customers assumed to be on BGSS) and the Proposed rate design.

All the components are separated into Delivery and Supply. In addition to the Distribution components of Delivery, also included in the Schedule are lines for Balancing Charge, Societal Benefits Charge, Margin Adjustment Charge, Gas Conservation Incentive Program, Green Programs Recovery Charge, Tax Adjustment Credit, Facilities Charge, Minimum Charge, Miscellaneous items, and Unbilled Revenue. The first column shows the annualized weather normalized billing units for the test year from Schedule SS-G2. The second column shows present Delivery rates (without Sales and Use Tax, SUT) effective April 1, 2024. The commodity rates in the second column reflect class-weighted averages for the test year from SS-G11. The third column presents annualized revenue for the test period assuming all customers are provided service under their applicable BGSS provision. The fourth column repeats the billing units of the first column. The fifth column shows the proposed rates that result in the proposed revenues shown in column six (6). Columns seven (7) and eight (8) show the proposed revenue increase, in thousands of dollars and percent increase, respectively, for each of the billing unit blocks.

DIRECT TESTIMONY

OF

AHMAD FARUQUI

PRINCIPAL EMERITUS

THE BRATTLE GROUP

April 15, 2024
P-10 R-1

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
AHMAD FARUQUI
PRINCIPAL EMERITUS - THE BRATTLE GROUP

Q. What is your name?

A. Ahmad Faruqui.

Q. What is your affiliation?

A. I am a Principal Emeritus with The Brattle Group.

Q. What are your qualifications?

A. I am an economist by training and have advised utilities, regulatory bodies, governments and legislative councils on all six continents. My CV is appended as Schedule AF-1.

Q. What is the topic of your testimony?

A. I am testifying in support of PSE&G's application for developing new time-of-use (TOU) rates for residential customers.

Q. What issues will you address in your testimony?

A. In my testimony, I provide the rationale for why TOU rates are more desirable than flat or inclining block rates, followed by a national overview of the state of TOU deployment. Then, I explain how PSE&G developed its TOU rates and discuss how it intends to deploy them.

Q. Why should rates be aligned with cost causation?

A. Cost causation is one of the fundamental tenets of rate design. It helps to promote economic efficiency and also promotes equity. It's mentioned in Professor Bonbright's widely cited text on public utility regulation.

Q. Why are TOU rates better aligned with cost causation than flat rates or inclining block rates?

A. Consumers don't consume the same amount of electricity around the clock. Electricity consumption varies by day, by month, and by season. In summer peaking utilities, air conditioning load creates a pattern of use that rises with temperature. Often, loads begin to rise in the afternoon and linger on into the evening hours. Load shapes are also driven by customer lifestyles. Since electricity cannot yet be stored in sufficient quantities, extra generation capacity has to be kept in reserve to meet peak loads. It stays idle most of the time and is expensive to install and operate. With flat rates, consumers have no incentive to conserve electricity during peak hours and to use more during off-peak hours. TOU rates provide customers an incentive to reduce peak load and to shift it to off-peak hours.

Q. What is the status of TOU rates in the US?

A. According to the US Energy Information Administration (EIA)[1], as of the year 2022, 380 utilities were offering time-varying rates including TOU rates and dynamic pricing rates to their residential customers. There were 13.1 million customers on these rates, representing 9% of all customers in the nation. However, it's worth noting that the average participant rate is skewed upwards by a few utilities. Nearly 60% of investor-owned utilities offering TOU rates have enrollment rates of less than 1% while some 15% of utilities have participation rates that exceed

[1] Annual Electric Power Industry Report, Form EIA-861, accessed at https://www.eia.gov/electricity/data/eia861/.

15%. Reasons for low enrollment at utilities include poor marketing of the TOU rate, inconvenient design (i.e., long peak period), and/or additional charges to cover the cost of an interval meter (where smart metering has not been deployed).

One of the primary reasons why TOU rate offerings are going up is the widespread deployment of smart meters. According to EIA[2], U.S. electric utilities had about 111 million advanced smart metering infrastructure (AMI) installations, representing 80% of all residential electric customers in 2021.

Q. How many pricing periods are typically to be found in a TOU rate?

A. About two-thirds of the utilities offer TOU rates with two periods and the remaining one-third offer TOU rates with three or more periods.

Q. What is the ratio of peak to off-peak prices in TOU rates?

A. According to the OpenEI database,[3] 85% of TOU rates have a price ratio greater than 2-to-1, with the mean value being 3-to-1. The mean differential between peak and off-peak rates is 12 cents/kWh. TOU rates with three periods have a similar price ratio as those with two period TOU rates and a similar differential.

Q. Based on your experience working with a wide range of utilities in the US and abroad and your review of the literature, why do utilities offer TOU rates?

A. In my view, the foremost reason why utilities offer TOU rates is to help customers manage their energy bills. Customers want choice and offering a TOU rate to them in addition to the existing rate (which could be flat or have an inclining block structure) accommodates that desire.

---

[2] US Energy Information Administration, accessed at https://www.eia.gov/tools/faqs/faq.php?id=108&t=3#:~:text=In%202021%2C%20U.S.%20electric%20utilities,electric%20meters%20were%20AMI%20meters.

[3] Utility Rate Database, accessed at https://openei.org/wiki/Utility_Rate_Database.

TOU rates encourage customers to shift their load away from the peak period and helps reduce costs for all customers over the long run. They also encourage off-peak usage which enhances the affordability of newly emerging, climate-friendly technologies, such as electric vehicles (EVs). Well-designed TOU rates represent a win-win situation for customers and their utilities.

Q. What is the typical duration of the peak period?

A. For a long time, utilities developed the duration of the peak period based on a review of prices in the wholesale market. The peak hours used to be 16 hours long and did not appeal to customers. Newer TOU rates, primarily designed to appeal to EV drivers, have much shorter peak periods, typically ranging from 4 to 6 hours. Peak periods used to cover the early afternoon hours, such as noon to 6 pm. Now they occur much later in the afternoon, and often range from 4 pm to 9 pm.

Q. How are the pricing periods developed?

A. Utilities typically develop pricing periods by reviewing recent data on annual hourly load shapes for system marginal costs and annual hourly load shapes for the system as a whole. Sometimes, they also review annual hourly load shapes for the residential class.

Q. How are prices developed by period?

A. Utilities typically develop them by reviewing hourly marginal energy costs and capacity costs for supply (capacity, energy, transmission and distribution). In this proceeding, PSE&G is only proposing changes in the distribution portion of rates. Since customers pay a single amount that includes generation, transmission and distribution, we have developed illustrative rates that include all these components. It's my understanding that the final version of TOU rates will be developed in future Basic Generation Service ("BGS") proceedings.

Q. Are system costs based on embedded or marginal costs?

A. In nearly every case that I am aware of, utilities base their rates on an embedded cost of service study. TOU rates are designed to be revenue-neutral for the class as a whole. Thus, a customer whose load shape resembles that of the class as a whole will see no change in their bill unless they change their load shape. If they lower their peak load and/or shift it to the off-peak period, they will realize bill savings. Peakier-than-average customers will see higher bills unless they reduce their peak load. Customers who are less peaky than the class average will realize immediate savings by choosing a TOU rate and if they lower their peak load, will realize even higher savings.

In a few cases, utilities also review a marginal cost of service study. However, these are only used to determine the ratio between peak and off-peak period charges. The absolute values are still based on an embedded cost of service study.[4]

Q. What are the different ways in which utilities deploy TOU rates to customers?

A. There are three modes of deployment: opt-in, opt-out and mandatory. Opt-in means the rate is offered to all customers. Any customer who wants to take it can sign up for it. Those customers who don't take the optional rate stay on their existing rate. Opt-out means that all customers are rolled over to the rate but any customer who does not want to stay on it can opt-out to another rate, which may be the prior rate or a new rate. Mandatory means that all customers are rolled over to the TOU rate and they have no choice. In Michigan, which has moved all customers to a default TOU rate, customers do have a choice to switch to other rates but they are also TOU rates.

[4] This method of developing rate is also called the equiproportional marginal cost method.

Q. How many TOU rates are deployed on an opt-in basis?

A. Most TOU deployments are on an opt-in basis.

Q. How many TOU rates are deployed on an opt-out basis?

A. In the US, California and Colorado have rolled out TOU rates as the default rate. In California, this was first done by a municipal utility, SMUD, which serves more than half a million customers in Sacramento and surrounding areas. It was then followed by all three large investor-owned utilities which serve 12 million customers. In Canada, the province of Ontario with some four million customers has rolled out TOU rates but they only apply to the energy portion of the rate.

Q. How many TOU rates are deployed on a mandatory basis?

A. The first utility to deploy TOU rates on a mandatory basis was Fort Collins, which serves nearly 69,000 customers. In Michigan, the two large investor-owned utilities, Consumers Energy and DTE, have deployed a TOU rate as the default and given customers a choice to opt-out to other TOU rates.

Q. Are pilots a pre-requisite for deploying TOU rates?

A. No. There have been scores of pilots around the US and many others around the globe. Utilities can safely proceed with offering opt-in TOU rates based on the experiences of other utilities, supplemented with insights gathered by conducting focus groups with their own customers. However, default and mandatory deployments should ideally be preceded by pilots. That has been the case in California, Colorado and Michigan.

Q. Is seasonal variation often found in TOU rates?

A. Yes, it's quite common, particularly in utilities where system load shapes vary across the seasons because of climatic factors, and this causes variation in the cost of service across seasons.

Q. What are the main features of well-designed TOU rates?

A. Well-designed TOU rates are customer-friendly and have short peak periods. They provide customers with an opportunity to save money by shifting their usage during the peak period to off-peak periods. Utilities provide videos on their web portal to educate customers on how they benefit by reducing peak loads and shifting energy consumption to the off-peak period. They often provide a bill calculator that allows customers to find the lowest cost rate that is consistent with their lifestyle. A single individual may have a different lifestyle than a young couple with no children or a family with young children or empty nesters.

Q. How can customers take advantage of TOU rates?

A. The penetration of EVs is growing fast. EVs are often the biggest load in a customer's house. Customers with EVs can set them to charge after midnight, when electricity costs are lowest. Customers with central air conditioning can precool their homes during the off-peak period by lowering their thermostat by a couple of degrees and raising it by a couple of degrees during the peak period. These days, most homes have programmable thermostats that make this a relatively easy task. Since central air conditioning is a big load in the house, this can yield substantial savings by itself. They can do their laundry during the off-peak hours. In addition, they can set the delay button on their dishwasher so it runs after midnight, which usually falls within the off-peak period.

Q. What utilities have successfully deployed opt-in TOU rates?

A. OGE in Oklahoma and APS and SRP in Arizona have successfully recruited large numbers of customers to TOU rates for years. They offer a choice of several TOU rates to their customers. In the past few years, utilities in Georgia, Missouri and New York have begun offering similarly well-designed rates to their customers on an opt-in basis. For additional details on the status of TOU rates in the US, please consult Schedule AF-2.

Q. Why is PSE&G planning to deploy TOU rates?

A. The primary purpose is to better reflect the cost of service. As noted earlier, this will promote economic efficiency and equity. There is a national trend toward TOU rates. This is being driven by a desire to combat climate change via electrification of buildings and transportation, and to manage the cost and operational challenges of that transition. EV deployment is rising fast. It's going to be potentially the biggest user of electricity in homes. Unless customers charge their EVs during off-peak and night time periods, they will end up creating a serious challenge to the grid. With TOU rates, they will be able to lower their charging costs and also reduce the strain on the grid. Of course, as noted earlier, smart meters are a pre-requisite to the widespread deployment of TOU rates.

Additionally, the Residential TOU Program meets PSE&G's commitment set forth in the BPU's CEF-EV Order to address rates for residential EV charging.[5]

Q. What specific TOU rates is PSE&G planning to deploy?

A. PSE&G is planning to offer two TOU rates to its residential customers. One TOU rate is going to be a two-period rate that modifies the existing Residential Load Management ("RLM")

[5] CEF-EV Order at 13 (Stipulation of Settlement, paragraph 33).

rate by shortening the peak period and enhancing the discount during the off-peak period. The other TOU rate will be a three-period TOU rate with a specially discounted night time rate to encourage night-time charging of EVs.

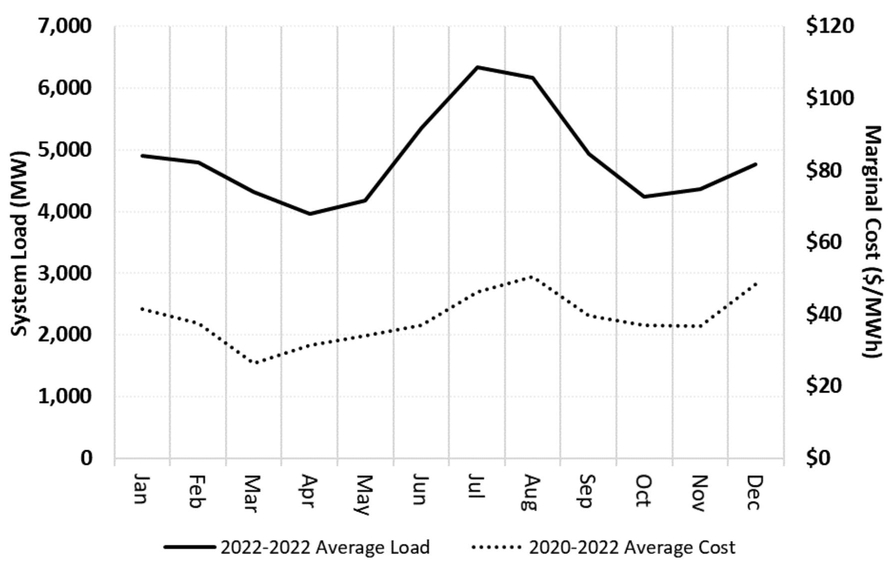
Q. Why is more than one TOU rate being offered?

A. To give customers choice, especially to those who drive EVs.

Q. How were they developed?

A. PSE&G is proposing to develop TOU rates focused on distribution costs in this proceeding. In a later filing, it will develop TOU rates focused on generation energy and capacity costs, transmission costs and all other costs. However, since customers pay a total bill, and not a separate distribution bill, in this testimony I have developed all-in TOU rates. We developed TOU pricing periods by reviewing data on hourly system load shapes, and hourly system marginal costs (equal to Day Ahead Locational Marginal Pricing ("LMPs")). These are summarized in Figure 1. System loads are shown on the vertical axis on the left and marginal costs on the vertical axis on the right.

Figure 1 Average System Load and Marginal Cost by Month (2020-2022)



The figure shows two distinct patterns across the year: winter and summer. Winter has eight months, which goes from October through December and January through May. Summer has four months, from June through September. This also aligns with PSE&G's gas season definition.

Figure 2 Typical Summer Weekday Profile (2020-2022)

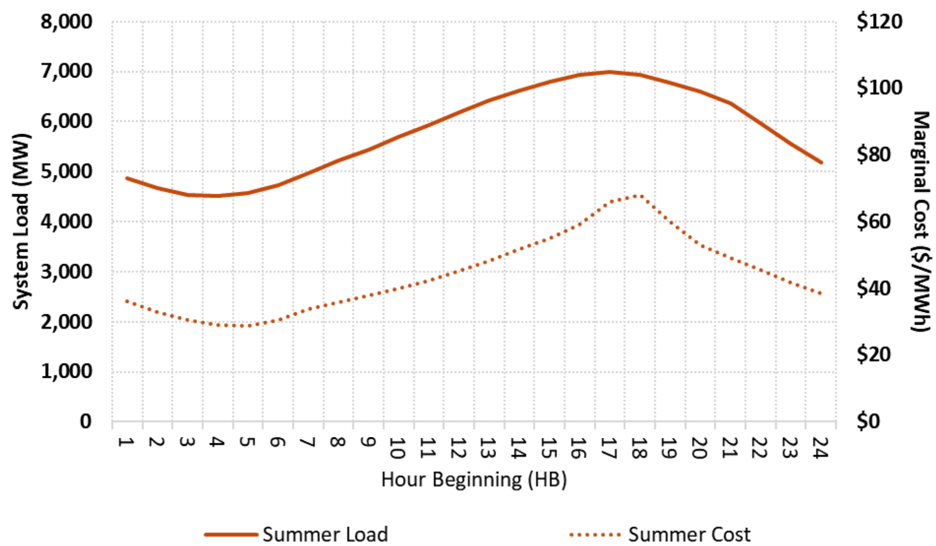


Figure 3 Typical Winter Weekday Profile (2020-2022)

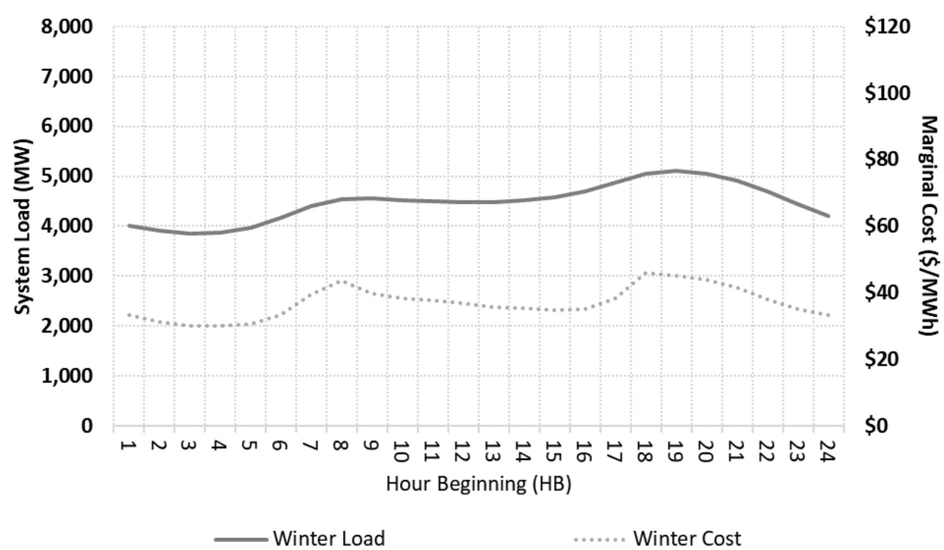

Winter features bimodal peaks with pronounced evening peak while summer features one pronounced evening peak. For simplicity and better customer experience, we propose adopting the same pricing period definitions for all seasons. The two-period TOU rate will have an on-peak time period that runs from 4 P.M. to 9 P.M. (EST) Monday through Friday, which is significantly shorter than the peak period in the existing TOU rate, and very much in line with the newer generation of TOU rates that are being offered in the US.[6] The three-period TOU rate will have the same on-peak period as the two-period TOU rate and will run from 4 P.M. to 9 P.M. (EST) Monday through Friday. In addition, it will have an off-peak period from 12 A.M. to 6 A.M. (EST) in all days that should appeal to EV drivers. All other hours shall constitute the Mid-Peak period.

Q. How did you design the two-period TOU rate?

A. The TOU rates were developed in close concert with Stephen Swetz of PSE&G and were designed to be revenue neutral with the RS rate class. As a starting point, Witness Swetz used PSE&G's embedded cost study for the Residential ("RS"), to develop TOU distribution rates. We designed generation rates to be revenue neutral to current the current RS default generation rates or Basic Generation Service ("BGS") RS rates. We used the Day-Ahead LMPs from PJM as a proxy for the marginal energy cost of generation. For other generation costs, we used costs that were used to develop BGS rates, then adjusted the results to ensure revenue neutrality. We designed transmission rates to be revenue neutral to the RS transmission rates but set rates to recover costs via certain TOU rate periods to better align with cost causation.

For the two-period TOU rate, we first calculated the summer and non-summer peak rates to reflect the generation, transmission, and distribution capacity and the generation energy costs. We allocated the remaining costs (net of revenue from peak hours and revenue from fixed

[6] The definition of current RLM on-peak period is 7 A.M. to 9 P.M. (EST) Monday through Friday during Daylight Savings Time. All other hours are considered as off-peak period.

charges) equally across the off-peak periods, solving for the corresponding rates to ensure revenue neutrality.

The current RS rate varies by season and is a two-tiered, inclining block rate. Under PSE&G's rate proposal, the average residential customer on the RS rate would pay 23 cents/kWh in the summer and 18 cents/kWh in the winter months. This reflects an increase of 24% in summer and an increase of 13% in winter compared to the current RS rate. Both rates are shown in the figure below.

Figure 4 Summary of Current and Proposed RS Rate

		Current RS Rate		Proposed RS Rate	
		Summer	Winter	Summer	Winter
Generation ($/kWh)	0-600	$0.077023	$0.080531	$0.090186	$0.093408
	Over 600	$0.086772		$0.099714	
Distribution ($/kWh)	0-600	$0.047449	$0.035553	$0.080977	$0.047232
	Over 600	$0.051523		$0.085052	
Transmission ($k/kWh)		$0.061233	$0.061233	$0.060495	$0.060495
Average Total Rate ($/kWh)		**$0.187680**	**$0.160734**	**$0.233601**	**$0.181044**
Monthly Charge ($/Month)		$4.95		$8.06	

Figure 5 Summary of Proposed Two-Period TOU Rate

	Two Period TOU			
	Summer		Winter	
	On Peak	Off Peak	On Peak	Off Peak
Generation ($/kWh)	$0.148113	$0.076570	$0.152283	$0.084049
Transmission ($/kWh)	$0.138172	$0.052115	$0.069086	$0.052115
Distribution ($/kWh)	$0.207875	$0.036604	$0.152494	$0.036604
Final Rate ($/kWh)	**$0.494159**	**$0.165289**	**$0.373863**	**$0.172769**
Monthly Charge ($/Month)	$8.06			

Under PSE&G's rate proposal, the average residential customer on the two-period TOU rate would pay 49 cents/kWh during the peak period and 17 cents/kWh during the off-peak period in the summer; in the winter, the corresponding values would be 37 cents/kWh during the peak period and 17 cents/kWh during the off-peak period.

Q. Why did you design a three-period TOU rate in addition to a two-period TOU rate?

A. The three-period TOU rate is designed to appeal to PSE&G's customers that drive electric vehicles ("EVs") but it would be made available to all residential customers.

Q. How did you design the three-period TOU rates?

A. Our methodology is like that of the two-period TOU rate. Like the two-period TOU rate, the three-period TOU rate is also revenue neutral, meaning that it collects the same amount of revenue for the class, before any load shifting.

Figure 6 Summary of Proposed Three-Period TOU Rate

	Three Period TOU					
	Summer			Winter		
	On Peak	**Mid Peak**	**Off Peak**	**On Peak**	**Mid Peak**	**Off Peak**
Generation ($/kWh)	$0.148113	$0.081894	$0.057873	$0.152283	$0.087528	$0.074252
Transmission ($/kWh)	$0.138172	$0.069086	-	$0.069086	$0.069086	-
Distribution ($/kWh)	$0.207875	$0.041730	$0.020864	$0.152494	$0.041730	$0.020864
Final Rate ($/kWh)	**$0.494159**	**$0.192709**	**$0.078738**	**$0.373863**	**$0.198344**	**$0.095116**
Monthly Charge ($/Month)	$8.06					

Under the three-period TOU rate, the average residential customer would pay 49 cents/kWh during the peak period, which is the same as the peak period price in the two-period TOU rate, 19 cents/kWh during the mid-peak period, and 8 cents/kWh during the off-peak period in the summer. In the winter, the corresponding values would be 37 cents/kWh during the peak period, 20 cents/kWh during the mid-peak period and 10 cents/kWh during the off-peak period. The figures below provide graphical illustrations of the rate.

Figure 7 Graphic Illustration of Two-Period TOU Rates (Summer)

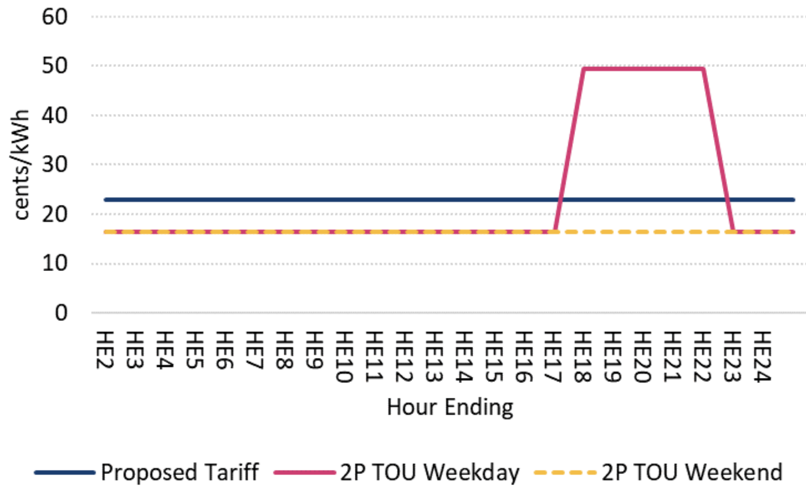

Figure 8 Graphic Illustration of Three-Period TOU Rates (Summer)

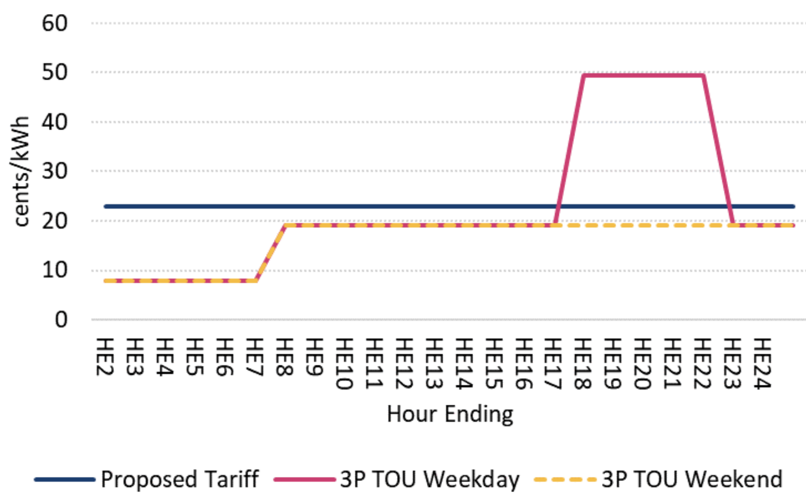

Q. How do the proposed TOU rates compare with those being offered by other utilities?

A. Structurally, they are quite similar. Since California has the largest number of customers on TOU rates, and since it also has the largest number of customers with EVs, I have compared PSE&G's rates with those being offered by PG&E, one of the largest investor-owned utilities in the US. It serves some 5 million electric customers in northern California and has a long history of offering TOU rates. It is also the utility which serves my residence. I have been taking service on TOU rates for three decades and drive an EV.

Figure 9 shows the two-period TOU rates for the two utilities and Figure 10 shows their three-period TOU rates. Structurally, the TOU rates are similar but since the average rate levels differ significantly for the two utilities (approximately 23 cents/kWh for PSE&G and approximately 38 cents/kWh for PG&E[7]), PSE&G's customers are always going to be paying less per kWh than PG&E's customers.

Figure 9: Comparison of PSE&G's Two-Period TOU rate with PG&E's

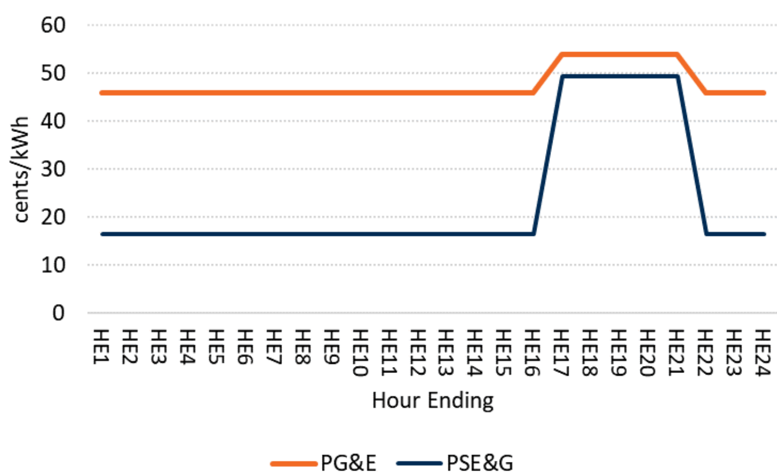

Figure 10: Comparison of PSE&G's Three-Period TOU rate with PG&E's

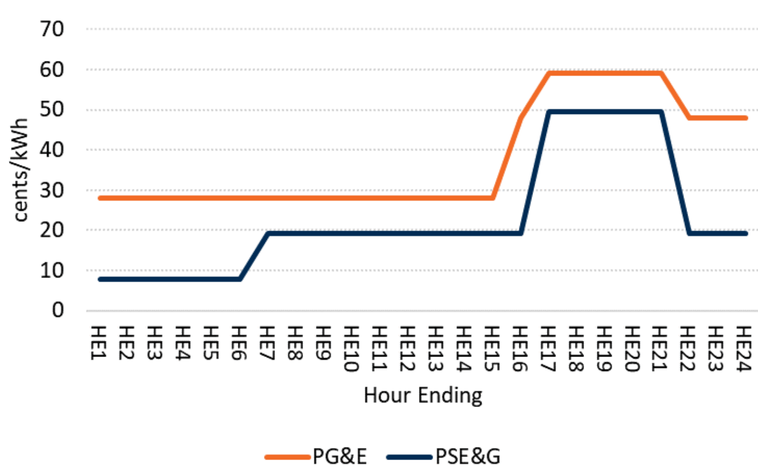

[7] As of April 1, 2024, PG&E's average rate has risen to 46.9 cents/kWh. The TOU rates have risen accordingly.

Q. Will the pricing periods in the TOU rates change at some point in the future?

A. Yes, they may change in the future if significant changes take place in the time pattern of system loads and system marginal energy and capacity costs. Such changes have occurred in utilities that have had TOU rates in place for decades. I have been on PG&E's TOU rates since the early 1990's. Back then, the on-peak period ran from noon to 6 pm. A decade or two later, it was changed and ran from 2 pm to 7 pm. Now it runs from 4 pm to 9 pm.

Q. Will the levels of the TOU rates change over time?

A. Yes, they may also change over time as significant changes take place in energy and capacity costs by time period.

Q. Are the rates designed to be revenue-neutral for the residential class?

A. Yes, they are. I have estimated the impact of the TOU rates on the average customer in a sample of 170 customers that was provided to me by PSE&G. The results are shown below in Figures 11 and 12, first for the two-period TOU rate, then for the three-period TOU rate. In the figures, positive numbers indicate bill savings and negative numbers indicate bill increases.

Figure 11 Average Bill Impact – Two-Period TOU

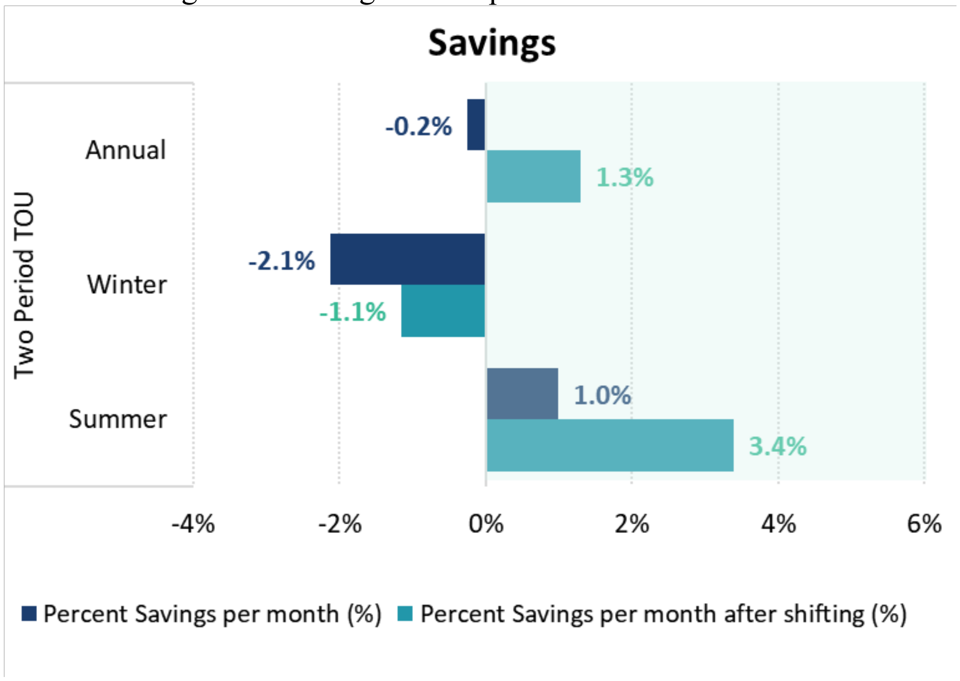

Figure 12 Average Bill Impact – Three-Period TOU

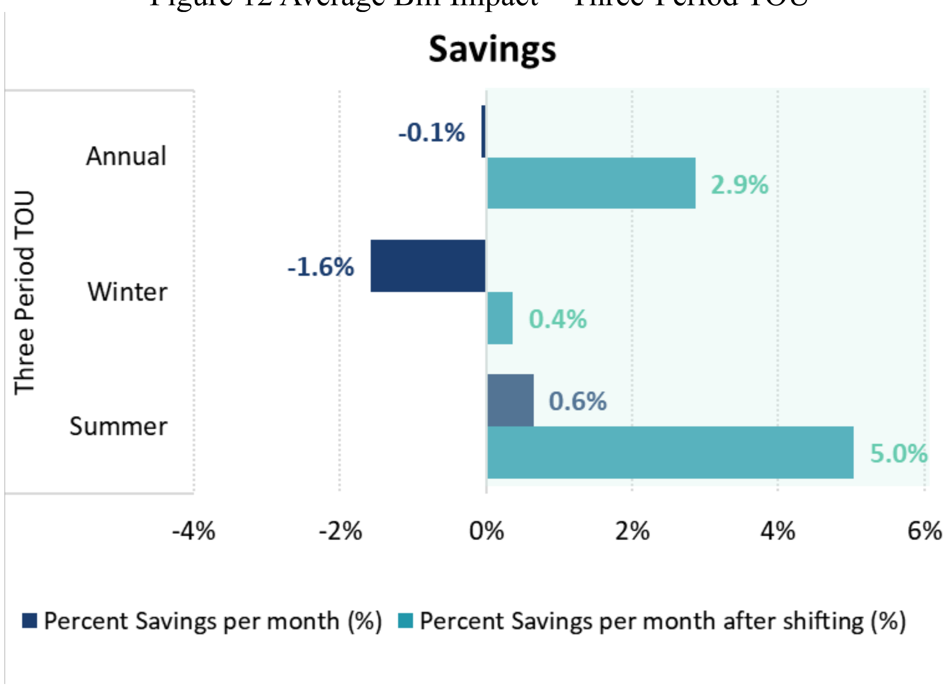

Q. What will be the likely impact of the TOU rates on customer bills?

A. Working with the sample of 170 customers, I estimated how each customer's bill will change if they were to move from the RS to each of the two TOU rates. For each rate, I rank ordered the bill impacts by customer so that the biggest drop in bills occur to the left of the chart and the highest rise in bills occur to the right of the chart. This creates the “propeller charts” that are shown below in Figures 13 and 14. These charts show how the two TOU rates will affect customer bills before they engage in any load shifting. Approximately half of the customers save money simply by switching to the TOU rates, even in the absence of load shifting: 49% in the case of the two-period rate and 48% in the case of the three-period rate.

Figure 13 Monthly Bill Impact on Sample Customers (Two Period TOU, without load shifting)

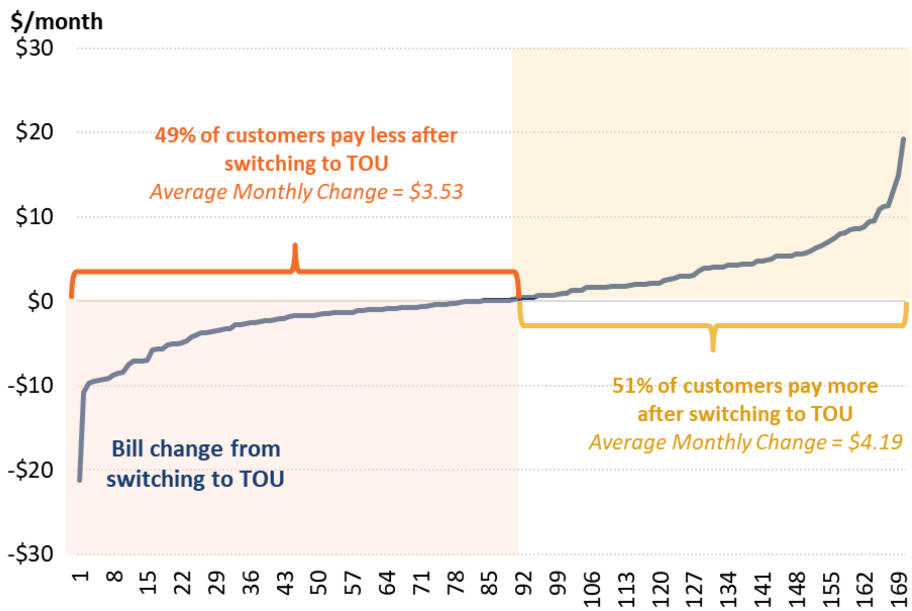

Figure 14 Monthly Bill Impact on Sample Customers (Three Period TOU, without load shifting)

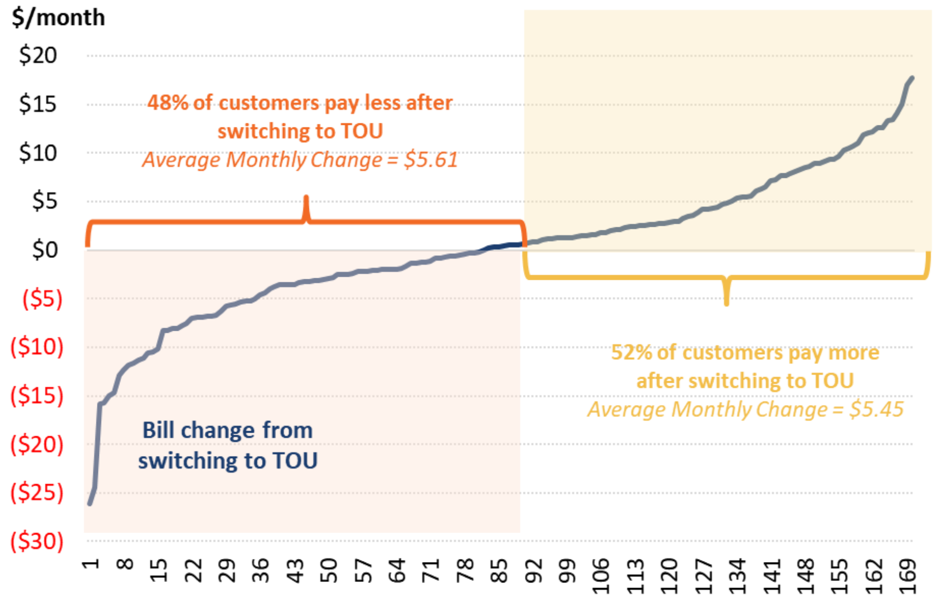

Q. How strong is the incentive to shift loads away from the peak period?

A. Strong price signals exist for shifting load away from the peak period in both the two-period and the three-period TOU rates. For the two-period TOU rate, the peak to off-peak price ratio is about 3:1 to one in summer months, and 2.2:1 for non-summer months. The three-period TOU rate has an even stronger price signal, with a 6.3:1 price ratio during the summer months between on-peak and off-peak period.

Figure 15 Summary of the On-Peak to Off-Peak Ratio

		Residential 2P TOU	Residential 3P TOU
Summer			
On-Peak	$/kWh	$0.494159	$0.494159
Mid-Peak	$/kWh	-	$0.192709
Off-Peak	$/kWh	$0.165289	$0.078738
Winter			
On-Peak	$/kWh	$0.373863	$0.373863
Mid-Peak	$/kWh	-	$0.198344
Off-Peak	$/kWh	$0.172769	$0.095117
On-Peak : (Mid-Peak): Off-Peak Ratios			
Summer		3 :1	6.3 :2.4 :1
Winter		2.2 :1	3.9 :2.1 :1

Q. As a result of the price incentives offered by these two TOU rates, how much will customers lower their peak demand?

A. Customers will have a strong incentive to reduce their peak loads in response to these two TOU rates and to shift that load to the non-peak periods. Using the analytical charts in Arcturus, a Brattle database that contains a meta-analysis of results from more than 400 deployments of time-varying rates around the globe, I would expect to see the following pattern of results for the two TOU rates.[8] In the summer, the two-period TOU rate would induce a drop of 10% in peak load and a drop of 7% in the winter. As for the three-period TOU rate, in the summer it would induce a drop of 16% in peak load and a drop of 12% in the winter.

[8] For the purposes of this testimony, the analysis is carried out using 127 observations pertaining to opt-in deployment of TOU rates from the Arcturus database. For background on Arcturus, please consult: https://www.brattle.com/wp-content/uploads/2023/02/Do-Customers-Respond-to-Time-Varying-Rates-A-Preview-of-Arcturus-3.0.pdf.

Figure 16 The Arc of Price Responsiveness – Two-Period TOU

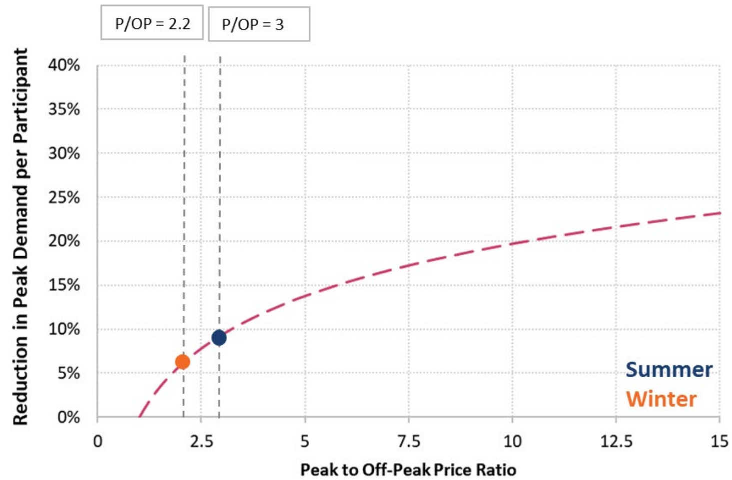

Figure 17 The Arc of Price Responsiveness – Three-Period TOU

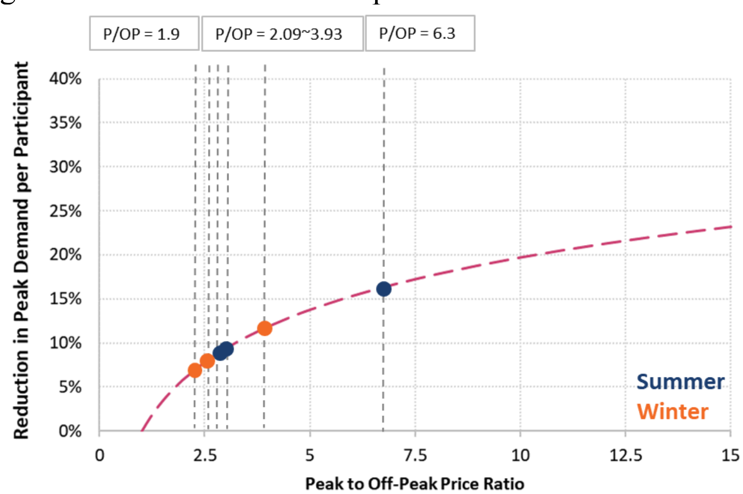

Q. When customers respond to TOU rates by reducing their peak loads, will their bills go down?

A. Yes, I would expect them to go down as they shift their usage from a costlier period to the less costly off-peak period in the case of the two-period TOU rate and to the less-costlier mid-peak and off-peak periods in the case of the three-period TOU rate. The propeller charts which include the effect of load shifting away from the peak period are shown below. They show that a greater percentage of customers will see lower bills than the results shown in the previous figures which assumed no load shifting. For the two-period rate, 69% of customers save money, compared to 49% in the absence of load shifting. For the three-period rate, 78% save money, compared to 48% in the absence of load shifting.

Figure 18 Monthly Bill Impact on Sample Customers (Two Period TOU, with load shifting)

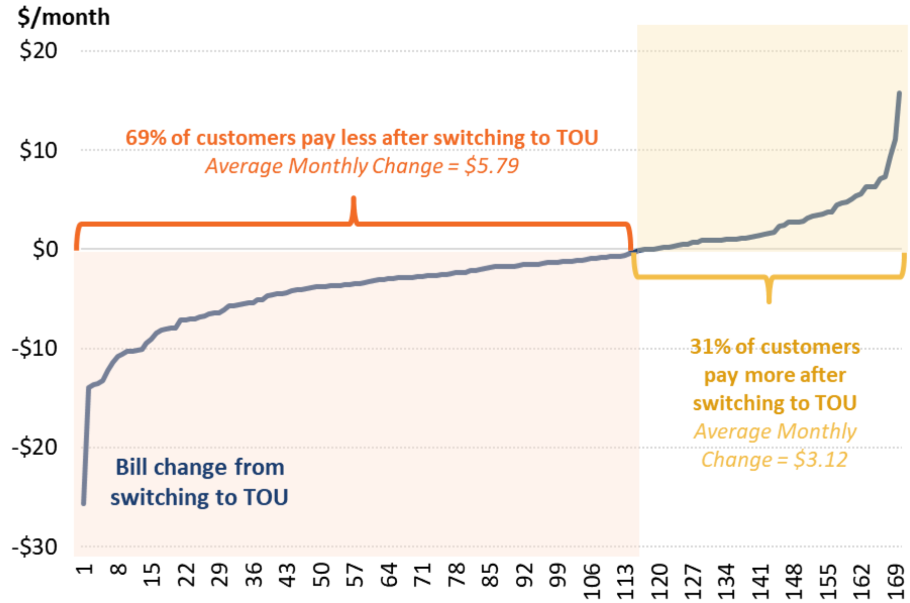

Figure 19 Monthly Bill Impact on Sample Customers (Three Period TOU, with load shifting)

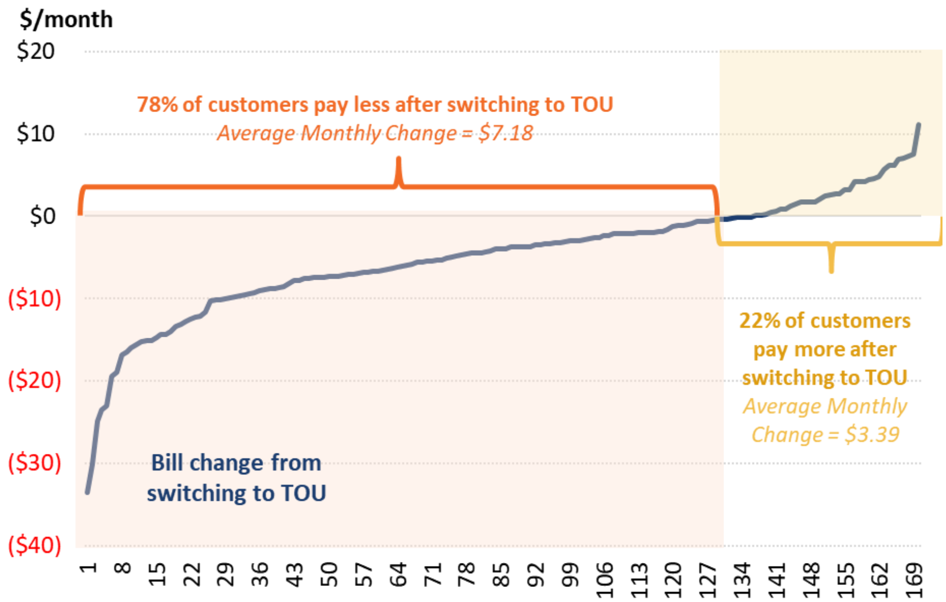

Q. Will any customer be harmed by switching to TOU rates?

A. No. PSE&G will provide bill protection for the first year that a customer is on a TOU rate. They will not see a bill increase. If their bill goes down, they will get to keep the savings. Also, if they don't like the TOU rate for any reason, they will be able to opt-out of it. Additionally, PSE&G will provide ideas on its web portal to help customers modify their pattern of consuming energy to maximize their bill savings.

Q. What is your general assessment of the two TOU rates that PSE&G is proposing to offer its residential customers?

A. PSE&G's TOU rates recognize that customers have diverse tastes and preferences. Some customers want simplicity in their tariffs, others value comfort, while others want to closely monitor their usage and lower their bills by changing the way they consume energy. PSE&G will continue to offer its existing RS Rate Schedule as the default residential rate. The two TOU tariffs will be complementary to the RS Rate Schedule. They will appeal to customers who want to lower their bills by reducing their usage during the peak period and shifting it to the off-peak period.

Q. What is your opinion of the two-period TOU rate?

A. The rate features a discount of 12% compared to the existing tariff in the off-peak period, and a premium of 163% compared to the price in the on-peak period in summer. Customers who are able to shift energy consumption from the on-peak period (which is 5 hours long) to the off-period (which is 19 hours long) in the summer will save 67% on each kWh that is shifted in summer and 54% on each kWh in winter. In my opinion, this rate will appeal to those customers who are able to shift significant end use loads from the on-peak to the off-peak period. For example, they could load their dishes in the dishwasher and set its timer to start operating at 9 p.m. They could program their thermostat so it's a few degrees lower during the off-peak hours in the summer months. If their normal setting is 74 degrees, they could raise it to 75 degrees during the on-peak hours and lower it to 73 degrees during the off-peak hours. The greater the differential in the temperature setting between the off-peak and on-peak periods, the more they will save.

Q. What is your opinion of the three-period TOU rate?

A. This rate features three pricing periods to provide a greater discount during the night time. Based on what I have observed in other jurisdictions where three-period TOU rates are being offered, it should appeal to customers who drive electric vehicles (EVs). They can simply set the timer in their cars to charge the battery during the off-peak hours. Most EVs can be fully charged in six hours and most drivers don't always fully charge their EVs. For each summer kWh shifted from the on-peak to the off-peak period, they will save 84%. For each summer kWh they shift from the on-peak to the mid-peak period, they will save 61%. For winter, the percentage savings are 75% and 47% from the on-peak to the off-peak and mid-peak period, respectively. In my opinion, this rate will appeal to customers who are seriously interested in saving money by moving significant portions of their load out of the on-peak period to the mid-peak and off-peak periods. This rate exemplifies the trends in modern rate designs: allowing customers to create significant savings opportunities by lowering demand when the grid is stressed. This would help PSE&G keep rates lower for customers in the long run by avoiding the need to invest in distribution infrastructure upgrades to meet higher peak demands.

Q. Is a shorter peak period likely to attract more customers than a longer peak period?

A. Yes. A shorter peak period is easier for customers to cope with than a longer peak period. Another advantage of the shorter peak period is that the price differential between on-peak and off-peak hours can be higher than with a longer peak period. Customers would save more for each kWh that is reduced and/or shifted to the off-peak period. In sum, a shorter on-peak period is easier for customers to cope with and also more rewarding. Thus, I would expect it to attract more customers.

Q. Should the TOU rate structure stay constant or change over time?

A. Over time, I would expect system load shapes and costs to change, due to changes in the mix of generation resources and in the manner that customers use electricity, driven by the increasing penetration of EVs and distributed energy resources, such as solar panels and battery storage. As such changes occur, the rate structure should change which may involve changing the duration of the pricing periods as well as the prices within the periods. However, the rates should not be changed every year.

Q. What is the optimal frequency for changing rates?

A. In my view, rate structures and parameters should not be changed too frequently to prevent customer confusion and frustration. Ideally, the structure of the rates and its key parameters should be kept constant over a five-year period. Of course, the price levels in each period may change during this period to reflect changes in the cost of service, market prices and other factors. But the price ratios and period definitions should not be changed too frequently.

Q. Would you expect the proposed TOU rates to be well received by customers?

A. Yes, I would. Customers are likely to appreciate being given more choices to lower their bills by making slight modifications in their lifestyle. All of them will have an opportunity to try out the new TOU rates and see if they can lower their bills. They will have bill protection for the first year and will only pay the lower of the TOU bill or the bill they would have paid with the standard rate. If are not able to lower their bill, they will have the option to get off the TOU rate at the end of their initial 12-month period.

Q. Does that conclude your testimony?

A. Yes.

STATE OF NEW JERSEY
BOARD OF PUBLIC UTILITIES

In the Matter of the Petition of
Public Service Electric and Gas Company
for Approval of an Increase in Electric and Gas
Rates and for Changes in the Tariffs for
Electric and Gas Service, B.P.U.N.J.
No. 17 Electric and B.P.U.N.J. No. 17
Gas, and for Changes in Depreciation Rates,
Pursuant to N.J.S.A. 48:2-18,
N.J.S.A. 48:2-21 and N.J.S.A. 48:2-21.1, and
for Other Appropriate Relief

BPU Docket Nos. ER23120924 and GR23120925

DIRECT TESTIMONY
OF
KAREN REIF
9+3 UPDATE

VICE PRESIDENT OF RENEWABLES AND ENERGY SOLUTIONS

April 15, 2024
P-11 R-1

Table of Contents

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
KAREN REIF
VICE PRESIDENT OF RENEWABLES AND ENERGY SOLUTIONS

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Karen Reif. My business address is 80 Park Plaza, Newark, New Jersey, 07102.

Q. In what capacity are you employed?

A. I am currently employed by Public Service Electric and Gas Company ("PSE&G" or "Company") as Vice President of Renewables and Energy Solutions. I have been employed by PSE&G for 28 years in a number of positions in trading, deregulated subsidiaries, information technology, and continuous improvement. I have held my present position since 2018. My credentials are set forth in Schedule KR-1.

Q. What is the purpose of your testimony?

A. As part of PSE&G's 2023 base rate filing with the New Jersey Board of Public Utilities ("BPU" or "Board"), the purpose of my testimony is to provide information regarding the PSE&G Clean Energy Future – Electric Vehicles ("CEF-EV") program that will support a finding by the Board that the investments and expenditures made by the program are prudent and reasonable. The Company should be permitted to establish rates in this proceeding that will permit recovery of both the CEF-EV costs that the Company proposes to include in to rates and the regulatory asset balances of CEF-EV capital and operation and maintenance ("O&M") costs that have been established in accordance with the Board's January 27, 2021 Order in BPU Docket No.

EO18101111.[1] My testimony will describe the programs and their implementation as well as costs and investments to date and expected during the test period. The details of the Company's accounting and cost recovery are presented in the testimony of witness Michael McFadden. The template for rate adjustments after this rate case proceeding as allowed in the CEF-EV Order are presented in the testimony of witness Mr. Stephen Swetz.

Q. Do you sponsor any schedules as part of your direct testimony?

A. Yes. I sponsor the following schedules that were prepared or compiled under my direction and supervision.

(1) Schedule KR-1 sets forth my credentials;

(3) Schedule KR-2 R-1 includes the Company's CEF-EV semi-annual reports as required by the CEF-EV Order. Revision R-1 of Schedule KR-2 adds the most recent semi-annual report (dated March 1, 2024), and adds the cover letter that accompanied each semi-annual report.

II. <u>THE COMPANY'S CEF-EV PROGRAMS</u>

Q. Please describe the Company's CEF-EV Program that was approved by the Board in its CEF-EV Order.

A. In 2018, in light of legislative and executive actions in New Jersey supporting electric vehicles, PSE&G filed its CEF-EV program in conjunction with a proposal for energy storage. [2]

[1] *I/M/O The Petition Of Public Service Electric and Gas Company For Approval Of Its Clean Energy Future – Electric Vehicle And Energy Storage ("CEF-EVES") Program On A Regulated Basis*, BPU Docket No. EO18101111, "Decision and Order Approving Stipulation" (January 27, 2021) ("CEF-EV Order"). The cost recovery mechanism established in that Board Order is discussed in the testimony of Michael McFadden.

[2] New Jersey's 2018 Clean Energy Law (P.L. 2018, c. 17, § 1(a)(2), directed the Board to conduct an analysis of whether implementation of energy storage systems would promote the use of electric vehicles, and Executive Order 28 called for the development of a revised Energy Master Plan to include exploration of methods to incentivize transportation electrification. Additionally at that time New Jersey had recently become a partner in California's zero-emission vehicle program that stipulated that large volume automobile manufacturers achieve a certain percentage of sales from EVs.

Subsequently, while PSE&G's program was pending approval, the legislature passed the Plug In Vehicle Act of 2020 directing the Board to adopt policies and programs to advance the adoption of EVs, and the Board issued an order implementing the Act establishing requirements for utility files for light-duty EV charging infrastructure.[3]

In 2021, the CEF-EV Order authorized PSE&G to invest up to $166.2 million in facilities associated with its CEF-EV programs and to incur up to $39 million of incremental O&M expenses, including administrative costs, to support the program. The CEF-EV programs consist of the following three subprograms: (i) a Residential Smart Charging program; (ii) a Level 2 Mixed Use Commercial Charging program; and (iii) a Public Direct Current ("DC") Fast Charging program.[4] The CEF-EV program also provides for cross-program investments for Information Technology ("IT") system upgrades and modifications that support administration of the program.

Q. Please describe the Residential Smart Charging subprogram.

A. The Residential Smart Charging program permits the Company to provide utility incentives to individual residential sites to offset up to $1,500 of the costs of electric facilities required between the utility electric meter and the EV charging stub. The program budget of $60 million is designed to provide make-ready costs for up to 40,000 charging stubs. The Make-Ready work from the meter to the charging station includes the pre-wiring of electrical infrastructure at a parking space or a set of parking spaces to facilitate easy and cost-efficient installation of EV Service Equipment. This program also permits the Company to provide utility incentives of up to $5,000 to offset the costs of making a site Charger-Ready from the utility pole to the meter. This

[3] PIV Act, P.L. 2019, c.362, codified at N.J.S.A. 48:25-1, *et seq*; *In the Matter of Straw Proposal on Electric Vehicle Infrastructure Build Out*, B.P.U. Docket No. QO20050357 (Order Adopting the Minimum Filing Requirements for Light-Duty, Publicly-Accessible Electric Vehicle Charging, September 23, 2020.

[4] The CEF-EV order holds PSE&G's energy storage proposal and a medium-heavy duty EV program in abeyance pending the Board's consideration of energy storage policy issues and policy for medium-heavy-duty EV charging infrastructure.

pole-to-meter work includes activities and facilities needed to upgrade an electric service to accommodate EV service equipment. The budget for this portion of the subprogram is $20 million and is designed to enable the Company to provide incentives at up to 4,000 locations.

Q. Please describe the Mixed Use Commercial Level 2 subprogram.

A. This subprogram is designed to incentivize the installation of 3,500 chargers at 875 sites that include multi-family unit developments, government facilities and public facilities. Under the program PSE&G will provide (i) utility incentives up to $7,500 per charger to cover the make-ready costs of serving up to 3,500 charger stubs up to a total investment of $26.25 million, and (ii) utility incentives to offset up to $10,000 of make-ready electric service upgrades for up to 875 locations, up to a total investment of $8.75 million.

Q. Please describe the Public DC Fast-Charging subprogram.

A. Under this subprogram, PSE&G will provide (i) utility incentives of up to $25,000 per charger of make-ready utility meter to charger stub costs for up to 1,200 fast charger stations, up to a total investment of $30 million, and (ii) utility incentives to offset up to $50,000 of make-ready electric service upgrade costs for up to 300 locations, up to a total investment of $15 million. Of the total $30 million of investments for make-ready utility meter to charger stub work, $5 million is being used to provide demand charge rebates to customers under Rate Schedules GLP and LPL.

Q. Did the CEF-EV Order authorize PSE&G to invest any other EV-related costs in addition to those associated with the three subprograms?

A. Yes. The Company was authorized to invest up to $6.2 million for EV-related IT upgrades.

Q. Did the CEF-EV Order authorize PSE&G to incur any incremental O&M costs?

A. Yes. The Board authorized the Company to incur and defer for future recovery the following O&M costs:

(i) $0.6 million for telematic tracking devices to understand residential charging behaviors of 500 customers;

(ii) $13.8 million for data acquisition costs for all deployed EV chargers for six years;

(iii) $8 million for marketing, education, and outreach to support the EV program; and

(iv) $16.6 million for O&M costs for all administrative services needed to support the EV program, including IT-related O&M.

III. COST RECOVERY

Q. Did the CEF-EV Order establish a method for the Company to account for and recover the costs of the CEF-EV Program?

A. Yes. The CEF-EV Order permitted the Company to establish two regulatory assets that allow it to defer for recovery in this rate case the capital and O&M costs of the CEF-EV program. Under the capital cost deferral, the Company is permitted to defer the capital costs of the CEF-EV program until those costs are rolled into rates in a future base rate case. The CEF-EV Order provided that subject to a prudence review of all CEF-EV costs, the Company's next base rate case would include a request for recovery of all prudently incurred costs associated with the CEF-EV program. Accordingly, in this case, the Company is proposing to recover the CEF-EV regulatory asset on CEF-EV related plant in-service that is or will be placed in service within six months of the end of the test year, as described in the testimony of Michael McFadden and set forth in Schedule MPM-17 R-1. Similarly, the Company is proposing recovery of the CEF-capital and

O&M regulatory assets, over the same period as set forth in Mr. McFadden's schedule MPM-49 R-1.

Q. How did the Company estimate investment levels and costs of the CEF-EV program?

A. The Company estimates these investment and cost levels based on a forecast that models participation levels and growth rates from program inception and uses investment averages per site and per charger for the average number of chargers per site. The costs are based on project costs and participation levels to date with indexes such as inflation and cost of living increases factored into the forecast.

Q. How will the Company recover future CEF-EV program costs?

A. CEF-EV investment that is not likely to be in service by six months following the end of the test year (November 30, 2024), will be deferred and placed in a regulatory asset. Consistent with the CEF-EV Order, this case will remain open so that CEF-EV investments placed in service after November 30, 2024 may be reviewed and placed into rates through annual rate adjustment filings after the Board issues an order at the conclusion of this proceeding. The Company's proposal for the methodology and schedule of the annual rate adjustment filings is set forth in the testimony of Mr. Swetz.

IV. PROGRESS IN IMPLEMENTING CEF-EV PROGRAMS

Q. Please describe implementation of the CEF-EV program.

A. Following the issuance of the CEF-EV Order, PSE&G undertook and completed program development, including development of the IT architecture and coordination with billing processes and systems necessary to administer the program, including EV-specific options such as time-of-use rebates. PSE&G then launched the CEF-EV Program in a series of steps from June through

September 2021, that included opening program enrollment applications, issuing demand charge rebates, and marketing and customer education activities.

Q. Following launch, please describe the enrollment levels in the various programs and the investment levels to date.

A. The program has been very successful to date and has exceeded expected enrollment levels for the overall program despite initial delays due in part to supply chain issues. As documented in the most recent semi-annual CEF-EV Program report that is included in Schedule KR-2 R-1, through December 2023, enrollments included 8,584 residential customers (8,775 Chargers), 130 Mixed Use Commercial customers (312 Chargers), and 51 DCFC customers in the CEF-EV Program (295 Chargers). These amounts will be updated in a future Company update.

Q. Has the Company implemented the CEF-EV Program in a reasonable and prudent manner consistent with the CEF-EV Order?

A. Yes. In implementing its CEF-EV program, PSE&G has used first-come, first-served implementation (*i.e.*, not based on geographical area or other preference) to encourage early participation and to eliminate the risk of bias or favoritism. Also, the Company's program application process ensures, consistent with the CEF-EV Order, that all customers or EV stations receiving an incentive must be networked, meaning that the charging station is capable of sending and receiving communications via a wi-fi or cellular network. Moreover, the Company has worked collaboratively with the signatory parties to the Stipulation adopted by the Board in the CEF-EV Order to refine and obtain charging data that has permitted the Company to prepare the residential and non-residential cost-of-service studies that are being presented by Company witness Mr. Swetz in support of corresponding proposed rate changes proposed in this proceeding.

Q. Please describe the Company's approach to customer education, outreach, and marketing activities for the CEF-EV program.

A. PSE&G engaged the services of a marketing consultant to help develop and manage the marketing, education, and outreach of the CEF-EV Program. The vendor collaborates with the Company to develop annual marketing plans that build upon the success of each previous year to market the program and educate customers most effectively. The overall marketing campaign included developing marketing materials in both digital and print, bill inserts, executing paid media ads, speaking at public conferences and EV-related webinars/seminars, and participating in multiple events such as National Drive Electric Week, Earth Day celebrations, and auto shows. Moreover, PSE&G actively participates in several EV organizations and has participated as speakers or panelists at multiple industry conferences and events.

Q. Is the Company proposing to use any public funding to offset the costs of the CEF-EV Program?

A. In accordance with the CEF-EV Order, PSE&G is committed to helping customers obtain all federal, state or local funding that can be used to offset the cost of the CEF-EV program. PSE&G's CEF-EV program web site's "FAQs" section advises potential participants that PSE&G incentives can be combined with other publicly funded EV incentive programs and includes links to other available State and Federal Programs.[5]

As part of the effort to maximize customers' cross-program participation the Company meets monthly with BPU Staff and the New Jersey Department of Environmental Protection ("NJDEP") to discuss implementation of the EV incentive programs managed by the Office of Clean Energy, NJDEP and the New Jersey Economic Development Authority "(NJEDA") that are available to customers alongside the utility-run programs. These meetings have resulted in the

[5] https://nj.myaccount.pseg.com/myservicepublic/electricvehicles

development of cross-promotional materials that have been posted on applicable State websites. Furthermore, PSE&G presented (virtually) to NJZIP stakeholders at a webinar scheduled by Rutgers University.[6] To the extent that any applicant for PSE&G's CEF-EV program receives public funding that, coupled with the incentives provided under the Company's program, results in a project being funded 90 percent or more, the Company will reduce its incentive funding and rebates to bring the total rebates and incentives under 90 percent of funding costs, though this scenario has rarely occurred.[7]

Q. Are there are any other steps that PSE&G takes to ensure that the costs of CEF-EV programs are reasonable?

A. Yes. PSE&G uses outside vendors to administer certain aspects of the program such as: data acquisition; marketing, education, and outreach; administrative program support; and application processing. When retaining outside vendors, PSE&G used a competitive bid process as part of the Company's procurement process to ensure the costs of procured services are reasonable. Moreover, all CEF-EV Program expenditures are subjected to an internal pre-approval review process that examines the cost prudency and appropriateness of the costs as part of the CEF-EV Program. As part of that process, the Company benchmarks against costs of similar services in other utility-led EV programs.

Q. In addition to the CEF-EV Order, are there other BPU requirements for utility EV incentive programs with which the CEF-EV program complies?

A. Yes. In April, 2023 the BPU issued an order directing the state's electric distribution companies including PSE&G to modify their respective EV programs to comply with the

[6] NJZIP is NJEDA's pilot EV incentive program that provides vouchers for medium-heavy duty EVs. *See* https://www.njeda.gov/njzip/ .

[7] The Company has reviewed 23 applications to date that have indicated receipt of public funding, and has had to reduce PSE&G's incentive on the basis of additional public funding only once. An additional 49 applications are pending review at this time.

requirements of the New Jersey Appliance Standards Law of 2022 (Appliance Act).[8] In compliance with this order, PSE&G added eligibility requirements for CEF-EV Program participants that EV chargers must be Energy Star certified.

Additionally, PSE&G requires program participants to provide charging data that PSE&G reports to the BPU in accordance with the November 2022 and November 2023 orders in the dockets establishing procedures for New Jersey electric distribution companies' basic generation service (BGS) auction requirements.[9]

Q. Does this conclude your direct testimony?

A. Yes. It does.

RE: CEF – EV PROGRAM BPU SEMI-ANNUAL REPORT – SEPTEMBER 2021

Dear Ms. Peterson and Mr. Lipman:

Pursuant to the Board's January 27, 2021 Order in the above referenced matter, enclosed is the Public Service Electric and Gas semi-annual activity report for the Clean Energy Future – Electric Vehicle Program. This report covers the period from January 1, 2021 through June 30, 2021.

Copies of the CEF-EV Semi-Annual Report – September 2021 will be served upon all entities legally required to be noticed. Service will occur via e-mail, only, pursuant to the Board's March 19, 2020 Order in Docket No. EO20020254.[1] In addition, the report will be posted at www.pseg.com/ev.

Clean Energy Future – Electric Vehicle (EV) Program

Semi-Annual Report to the Board of Public Utilities

H1-2021 – January through June 2021

Table of Contents

Section 1: Estimated Quantity of Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: As of June 30, 2021, PSE&G has given no rebates for infrastructure development. PSE&G has invested in IT systems to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding;

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. PSE&G received 8 applications for the DCFC Distribution Demand Charge Rebate on June 30, 2021 that are under review.

Funding Balance

See Table 2 for the balance remaining of the $5 million rebate funding. No DCFC Distribution Demand Charge Rebates were issued this reporting period.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other.

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

Clean Energy Future – Electric Vehicle (EV) Program

Semi-Annual Report to the Board of Public Utilities

H2-2021 – July through December 2021

Table of Contents

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program ("CEF-EV Program").

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September, 2021 as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: As of December 31, 2021, PSE&G has invested a total of $4.2M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging ("DCFC") Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. Through December 31, 2021, PSE&G has enrolled 32 customers to the DCFC Distribution Demand Charge Rebate.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. As of December 31, 2021, PSE&G distributed $292,680 in demand charge rebates for this reporting period. There is $4.7M remaining in the funding.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021. As of December 31, 2021, the CEF Program has enrolled 218 residential customers, 5 Mixed Use Commercial customers, and 32 DCFC customers in the CEF-EV Program.

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

RE: CEF – EV PROGRAM BPU SEMI-ANNUAL REPORT – SEPTEMBER 2022

Dear Mr. Lupo and Mr. Lipman:

Pursuant to the Board's January 27, 2021 Order in the above referenced matter, enclosed is the Public Service Electric and Gas semi-annual activity report for the Clean Energy Future – Electric Vehicle Program. This report covers the period from January through June, 2022.

Copies of the CEF-EV Semi-Annual Report will be served upon all entities legally required to be noticed. Service will occur via e-mail, only, pursuant to the Board's March 19, 2020 Order in Docket No. EO20020254.[1] In addition, the report will be posted at www.pseg.com/ev.

Clean Energy Future – Electric Vehicle (EV) Program

Semi-Annual Report to the Board of Public Utilities

H1-2022 – January through June 2022

Table of Contents

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program ("CEF-EV Program").

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September 2021 as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: As of June 30, 2020, PSE&G has invested a total of $7.3M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging ("DCFC") Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 3: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. Program to date, PSE&G has enrolled 33 customers to the DCFC Distribution Demand Charge Rebate, comprising of 242 chargers.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. As of June 30, 2022, PSE&G distributed $482,768 in demand charge rebates for this reporting period. There is $4.5M remaining in the funding.

Section 2: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021. As of June 30, 2021, the CEF Program has enrolled 670 residential customers (678 Chargers), 11 Mixed Use Commercial customers (17 Chargers), and 33 DCFC customers in the CEF-EV Program (242 Chargers).

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

Clean Energy Future – Electric Vehicle (EV) Program

Semi-Annual Report to the Board of Public Utilities

H2-2022 – July through December 2022

Table of Contents

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment (“CEF-EV Report”) with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program (“CEF-EV Program”).

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September 2021 as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: Program to date, PSE&G has invested a total of $13M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging (“DCFC”) Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021 with credits issued retroactive to program approval on January 27, 2021. Program to date, PSE&G has enrolled 35 customers to the DCFC Distribution Demand Charge Rebate, comprising of 252 chargers.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. Program to date, PSE&G distributed $628,777 in demand charge rebates, of which $210,532 was distributed this reporting period. There is $4.4M remaining in the funding. Year 3 of the credit will begin on January 27, 2023, with the distribution demand charge rebate adjusted from 75% to 50%.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021.

Program to date, the CEF Program has enrolled 1,974 residential customers (1,995 Chargers), 33 Mixed Use Commercial customers (63 Chargers), and 35 DCFC customers in the CEF-EV Program (252 Chargers).

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

Table 1: CEF-EV Program Summary

RE: CEF – EV PROGRAM BPU SEMI-ANNUAL REPORT – SEPTEMBER 2023
***and* PROVISION OF BASIC GENERATION SERVICE (BGS) – JUNE 2023**

Dear Mr. Cummings and Mr. Lipman:

Pursuant to the Board's January 27, 2021 Order and November 09, 2022 Order in the above referenced matters, enclosed is the semi-annual activity report for the Clean Energy Future – Electric Vehicle (CEF-EV) Program, including the residential EV and DCFC Charging data. This report covers the period from January through June, 2023.

Copies of the CEF-EV Semi-Annual Report will be served upon all entities legally required to be noticed. Service will occur via e-mail, only, pursuant to the Board’s March 19, 2020 Order in Docket No. EO20020254.[1] In addition, the report will be posted at www.pseg.com/ev.

Please advise if you have any questions or comments.

Respectfully submitted,

Clean Energy Future – Electric Vehicle (EV) Program

Semi-Annual Report to the Board of Public Utilities

HY1-2023 – January through June 2023

Table of Contents

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program ("CEF-EV Program").

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology ("IT") architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September 2021. Since that time PSE&G has continued to enroll eligible customers as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: Since program inception, PSE&G has invested a total of $21M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging ("DCFC") Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. Program to date, PSE&G has enrolled 41 customers to the DCFC Distribution Demand Charge Rebate, comprising of 267 chargers.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. Since program inception, PSE&G distributed $780,571 in demand charge rebates. There is $4.2M remaining in the funding.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021. Since program inception, the CEF Program has enrolled 5,405 residential customers (5,640 Chargers), 72 Mixed Use Commercial customers (143 Chargers), and 41 DCFC customers in the CEF-EV Program (267 Chargers).

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: EV Charging Data Summary

The CEF-EV Program semi-annual report will include a submittal of the following data:

- Residential EV Charging Data
- Direct Current Fast Charging (“DCFC”) Data

The submittal will provide the total energy consumed, capacity and transmission tags, measured demands, connected load, and the resulting load factor.

Residential EV Charging Data

The Residential EV charging data is summarized in Table 6.

DCFC Data Definitions

The DCFC EV charging data is summarized in Table 7.

RE: CEF – EV PROGRAM BPU SEMI-ANNUAL REPORTS

Dear Ms. Peterson and Mr. Lipman:

Pursuant to the Board's January 27, 2021 Order in the above referenced matter, enclosed is the Public Service Electric and Gas March 2024 semi-annual activity report for the Clean Energy Future – Electric Vehicle Program. The March 2024 report covers the period from July through December, 2023.

Also enclosed are revised versions of three previously-submitted reports that the Company recently discovered contain errors. The revised reports and corrections are as follows:

Revised Report	Revised Section	Revised Information
September 1, 2021	Table 1	Total Costs in Reporting Period, Program-to-Date, To-Go Forecast, and Total Program Forecast
September 1, 2022	Table 3	Total Investment in June 2022
March 1, 2023	Table 1	Investment for H2 2022
	Table 4	Administration & Program Development Remaining Funding by Category

Copies of the enclosed CEF-EV Semi-Annual Reports will be served upon all entities legally required to be noticed. Service will occur via e-mail, only, pursuant to the Board's March 19, 2020 Order in Docket No. EO20020254.[1] In addition, the report will be posted at www.pseg.com/ev.

Please advise if you have any questions or comments.

Respectfully submitted,

Katherine E. Smith

Clean Energy Future – Electric Vehicle (EV) Program

Semi-Annual Report to the Board of Public Utilities

H2-2023 – July through December 2023

Table of Contents

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g., Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program ("CEF-EV Program").

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September 2021. Since that time PSE&G has continued to enroll eligible customers as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: Since program inception, PSE&G has invested a total of $31M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging ("DCFC") Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding.

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. Program to date, PSE&G has enrolled 51 customers with a total of 295 chargers to the DCFC Distribution Demand Charge Rebate.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. Since program inception, PSE&G distributed $965,441 in demand charge rebates. There is $4M remaining in the funding.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021. Since program inception, the CEF Program has enrolled 8,584 residential customers (8,775 Chargers), 130 Mixed Use Commercial customers (312 Chargers), and 51 DCFC customers in the CEF-EV Program (295 Chargers).

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: EV Charging Data Summary

The CEF-EV Program semi-annual report will include a submittal of the following data:

- Residential EV Charging Data
- Direct Current Fast Charging (DCFC) Data

The submittal will provide the total energy consumed, capacity and transmission tags, measured demands, connected load, and the resulting load factor.

Residential EV Charging Data

The Residential EV charging data is summarized in Table 6.

DCFC Data Definitions

The DCFC EV charging data is summarized in Table 7.

Section 5: Tables

CEF-EV Semi Annual Report September 2021 – REVISED

Clean Energy Future – Electric Vehicle (EV) Program

Semi-Annual Report to the Board of Public Utilities

H1-2021 – January through June 2021

Revised March 1, 2024

Table of Contents

Section 1: Estimated Quantity of Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

<u>Major Tasks Completed</u>: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

<u>Quantity Completed</u>: As of June 30, 2021, PSE&G has given no rebates for infrastructure development. PSE&G has invested in IT systems to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding;

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. PSE&G received 8 applications for the DCFC Distribution Demand Charge Rebate on June 30, 2021 that are under review.

Funding Balance

See Table 2 for the balance remaining of the $5 million rebate funding. No DCFC Distribution Demand Charge Rebates were issued this reporting period.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other.

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

CEF-EV Semi Annual Report September 2022 – REVISED

Clean Energy Future – Electric Vehicle (EV) Program

Semi-Annual Report to the Board of Public Utilities

H1-2022 – January through June 2022

Revised March 1, 2024

Table of Contents

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program ("CEF-EV Program").

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September 2021 as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: As of June 30, 2020, PSE&G has invested a total of $7.3M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging ("DCFC") Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 3: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. Program to date, PSE&G has enrolled 33 customers to the DCFC Distribution Demand Charge Rebate, comprising of 242 chargers.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. As of June 30, 2022, PSE&G distributed $482,768 in demand charge rebates for this reporting period. There is $4.5M remaining in the funding.

Section 2: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021. As of June 30, 2021, the CEF Program has enrolled 670 residential customers (678 Chargers), 11 Mixed Use Commercial customers (17 Chargers), and 33 DCFC customers in the CEF-EV Program (242 Chargers).

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

CEF-EV Semi Annual Report March 2023 – REVISED

Clean Energy Future – Electric Vehicle (EV) Program

Semi-Annual Report to the Board of Public Utilities

H2-2022 – July through December 2022

Revised March 1, 2024

Table of Contents

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program ("CEF-EV Program").

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September 2021 as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: As of June 30, 2020, PSE&G has invested a total of $13M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging ("DCFC") Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. Program to date, PSE&G has enrolled 35 customers to the DCFC Distribution Demand Charge Rebate, comprising of 252 chargers.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. As of June 30, 2021, PSE&G distributed $628,777 in demand charge rebates for this reporting period. There is $4.4M remaining in the funding.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021. As of June 30, 2021, the CEF Program has enrolled 1,974 residential customers (1,995 Chargers), 33 Mixed Use Commercial customers (63 Chargers), and 35 DCFC customers in the CEF-EV Program (252 Chargers).

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

Table of Contents

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
DAVID JOHNSON
VICE PRESIDENT – CUSTOMER CARE AND
CHIEF CUSTOMER OFFICER PSE&G

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is David Johnson. My business address is 80 Park Plaza, Newark, New Jersey, 07102.

Q. In what capacity are you employed?

A. I am currently employed by Public Service Electric and Gas Company ("PSE&G" or "Company") as Vice President Customer Care and Chief Customer Officer (COO). I have over 25 years of experience in customer service for energy providers. For example, I previously served as CCO for Duquesne Light Company in Pittsburgh, PA, Vice President for Customer Service at Entergy Louisiana and Senior Vice President of Customer Service at DTE Energy. In my current role, I am responsible for the successful deployment of the CEF-EC program and operationalizing the AMI capabilities that result from this program. Implementation of the CEF-EC program and AMI functionalities involve many of the areas that I oversee including billing, meter reading, collections, customer experience and the contact center.

Q. What is the purpose of your direct testimony?

A. As part of PSE&G's 2023 base rate filing with the New Jersey Board of Public Utilities ("BPU" or "Board"), the purpose of my testimony is to provide information that will support a finding by the Board that the investments and expenditures made by PSE&G for its Clean Energy Future – Energy Cloud ("CEF-EC") program are prudent and reasonable. The CEF-EC costs that the Company proposes to recover in this proceeding are the investments placed in service by November 30, 2024, six months after the end of the test year, as well as the regulatory asset balances of the CEF-EC Infrastructure Deferral, Stranded Cost Deferral and Operation and Maintenance ("O&M") regulatory assets that have been established in accordance with the Board's January 7, 2021 Order in BPU Docket No. EO18101115 that authorized the CEF-EC program and establishment of the CEF-EC regulatory assets.[1] The accounting and cost recovery for the program and the treatment of depreciation are described in the testimony of Company witness Mr. Michael McFadden.

Q. Do you sponsor any schedules as part of your direct testimony?

A. Yes. I sponsor the following schedules that were prepared or compiled under my direction and supervision.

(1) Schedule DJ-1 sets forth my credentials;

(2) Schedule DJ-2 R-1 provides the CEF-EC semi-annual reports that have been submitted to BPU Staff to date. Revision R-1 of Schedule DJ-2 adds the most recent semi-annual report (dated February 26, 2024), and adds the cover letter that accompanied each semi-annual report.

---

[1] *I/M/O The Petition of Public Service Electric and Gas Company for Approval of Its Clean Energy Future – Energy Cloud ("CEF-EC") Program on a Regulated Basis*, BPU Docket No. EO18101115, "Decision and Order Approving Stipulation" (January 7, 2021) ("CEF-EC Order").

II. <u>THE COMPANY'S CEF-EC PROGRAM AND CURRENT STATUS</u>

Q. Please describe the Company's CEF-EC Program that was approved by the Board in its CEF-EC Order.

A. By Order dated February 19, 2020, the Board found that AMI is a means to achieve the objectives of the 2019 Energy Master Plan ("EMP").[2] Accordingly, the Board directed PSE&G and other utilities to file petitions for AMI implementation. In the CEF-EC Order, the Board authorized the Company to install approximately 2.2 million Advanced Meter Infrastructure ("AMI") meters at an estimated investment cost of up to $707 million for the advanced meters, network infrastructure and associated information technology required to implement Release 1 of the CEF-EC program. The Company planned to install AMI meters over the period 2021 to 2024 in accordance with the following schedule:

2021	80,000 meters
2022	300,000 meters
2023	900,000 meters
2024	900,000 meters

Under the CEF-EC Order the Company had the right to accelerate this deployment schedule to effectuate the efficient deployment of AMI meters. The Company began installing AMI meters during 2021 and 2022 according to this plan and, beginning in 2023, conducted an accelerated geographic strategic deployment in which the Company divided its service territory into three separate regions and employed a strategy to identify and group meters for replacement on a daily basis. The Company utilized its existing manual meter reading assignments to develop a deployment strategy to support the efficient deployment of AMI meters and consolidation of meter reading assignments.

[2] *In re the Petition of Rockland Electric Company for Approval of an Advanced Metering Program, and for Other Relief*, BPU Docket No. ER16060524 (February 19, 2020).

Q. What is the current status of PSE&G's AMI installation project?

A. The project is currently ahead of its installation schedule and under the program budget.

Q. What is the status of the AMI network installation and functionality?

A. The Company completed installation of its Landis + Gyr Network ("Network") in June 2022, and 100 percent of the Network was communicating by September of 2022.

Q. How many AMI meters have been installed so far?

A. As of February 29, 2024, 1,494,038 residential and 195,319 commercial AMI meters have been installed, for a total of 1,689,357. Installations are expected to continue ahead of pace.

Q. Is the Company projecting to complete full AMI deployment within six months beyond the end of the rate case test year (by November 30, 2024)?

A. At this time, yes, PSE&G projects full deployment will be accomplished by November 30, 2024, and possibly could be accomplished earlier.[3] Certain factors that are difficult to predict may impact the timing, such as new supply chain issues, or other issues impacting PSE&G's ability to obtain AMI meter inventory or impacting the labor force. Based on current conditions, the Company expects to finish ahead of schedule.

Q. What are program costs compared to the program forecast as of February 29, 2024?

A. Total actual costs as of February 29, 2024, were approximately $442 million (approximately $404 million for capital and $38 million for O&M). PSE&G forecasts total costs of the Program upon completion in November 2024 to be $625 million (approximately $570 million for capital and $55 million for O&M) well below the approved amount of up to $779 million ($707 for capital and $72 for O&M).

[3] With the exception of customers who elect to opt out of an AMI meter.

Q. How has PSE&G managed implementation of the CEF-EC program to deliver the program to date significantly under the forecast budget?

A. PSE&G has achieved numerous meter deployment efficiencies by implementing the following strategies.

Successful customer communications ahead of meter changes has resulted in an approximate 84% success rate of changing the meter on the first visit. While some areas remain at 90% but as the Company addresses harder to access areas the percentage will be impacted. Making only a single visit to a customer location has reduced the need for appointments and unscheduled visits, which, by nature, are less productive and more costly.

Additionally, PSE&G has worked closely with the meter installation vendor to optimize meter change routes. The meter change schedule was organized by "sectors," which are geographic areas. Each sector was carefully designed to reduce travel time both within each sector and to the various warehouses and laydown yards.

PSE&G's internal workforce has also taken advantage of "opportunistic" meter changes on customers' premises. In other words, as PSE&G has been visiting customer homes to address meter-related issues, such as non-registering meters or high bill complaints, PSE&G has taken the opportunity to replace the existing meter with an AMI meter at that visit. This eliminates the need for a separate, future visit just to change that customer's meter.

III. BENEFITS OF CEF-EC PROGRAM INVESTMENTS

Q. Recognizing that the Company has not concluded the implementation of its CEF-EC program, have the benefits of the program identified previously by PSE&G begun to be realized?

A. Yes. PSE&G's CEF-EC program strategy prioritized delivering the benefits of AMI meters to customers as soon as possible following AMI meter installation. The program currently is delivering substantial benefits to customers. Some benefits have been, or are expected to be, achieved ahead of the forecast schedule for delivery.

Q. Please generally explain AMI customer benefits and the expected timing of achieving these benefits.

A. As a result of PSE&G's CEF-EC program deployment design, some customer benefits are already active, such as billing on actual usage transmitted by the AMI meters, and remote capabilities such as move in/move out and disconnect/reconnect.

Additionally, as set forth in the CEF-EC Order, other benefits are achievable over longer periods. In the October 11, 2018 filing to implement the CEF-EC program, the Company proposed a program that would implement 22 out of a total of 70 potential AMI functionalities or "Use Cases" that focused on customer engagement, network operations and planning, and new utility products and services.[4] PSE&G committed in the stipulation of settlement approved by the CEF-EC Order to use "best efforts" to provide the AMI capabilities of the 22 Use Cases within the approved program budget, and the parties recognized that, "these capabilities may not be available until after the full deployment if the AMI meters is complete."[5]

Notwithstanding, PSE&G's CEF-EC program to date has already accomplished deployment of multiple Use Cases that benefit all customers by improving the efficiency of operations and reducing truck dispatches that would previously have been required to perform move in/move out and reconnects.

---

[4] Those 22 use cases were referred to as "Release 1." *See* CEF-EC Order at Stipulation ¶ 3. The remaining 48 Use Cases were generally described in PSE&G's AMI cost-benefit analysis that accompanied its 2018 filing, and could be proposed as part of future program proposal filings but are not included in the budget or implementation of the currently approved CEF-EC Program.

[5] CEF-EC Order at Stipulation ¶ 17.

Q. Beginning with the most basic AMI functions, when AMI meters are installed, when does data begin to communicate with the Company's systems, and is the AMI data being used for billing?

A. PSE&G's primary goal for the CEF-EC program is that after each meter is installed, the customer will receive an accurate bill utilizing an AMI meter read. Following installation of a meter, PSE&G verifies that the meter is communicating with the Company's systems. After three successful days communicating, the billing system utilizes the AMI read to bill the customer. The Company has achieved a sustained AMI actual read billing rate of over 99 percent. Where there have been a small number of communication issues, these are addressed expeditiously.

Q. Regarding the 22 Use Cases, please provide an overview and the status of their deployment.

A. These 22 Use Cases and deployment status are as follows:

Use Case #	Use Case Name	Deployment Status	Use Case Overview & Value
1,2,3,4	1. Enhanced Customer Engagement & Communications	**Deployed Q3, 2023** (customer access to usage data via portal) **Deployment scheduled Q2, 2024** (enable customer inquiries via portal)	A set of customer benefiting functions and analytic applications that provide visualizations and analytics across a variety of customer and iESP data combined with other data – bills, usage, prices, tips, alerts, energy efficiency, appliance profiles, new products and services, notifications, and available through mobile and web portals.
	2. Rate Analyzer & Comparator	**Deployment scheduled Q3, 2024**	
	3. Usage & Bill Alerts, Saving Tips, Interactive Bill Presentment	**Deployment scheduled Q2, 2024**	
	4. Interactive Energy Demand & Bill Management (Portal part of Meter Data Management System - MDMS project)	**Deployment scheduled Q2, 2024**	
5	Customer Segmentation & Behavioral Analysis	**Deployed Q4, 2023** (pull system) **Deployment scheduled Q2, 2024** (push system)	Provides the ability to develop highly targeted customer segmentation models based on more granular energy usage data and customer interactions to improve customer service, marketing, time of use ("TOU") rates, new products and services, and planning load forecasts. Capability depends on data integration to PSE&G systems to enable usage via "pull system" and "push system"

Use Case #	Use Case Name	Deployment Status	Use Case Overview & Value
6	Customer Power Quality	**Deployment scheduled Q3, 2024**	Capability that allows PSE&G to obtain voltage, load, and alert data directly from the meter to analyze customer power quality issues (flicker, sag, swell), without the need for further instrumentation, and can also help ensure appropriate corrective actions are taken (utility or customer side of the meter).
7	Customer Energy Efficiency Programs (Thermostats & Supporting CEF-EE Filing)	**Deployed Q4, 2023**	iESP data gives the customer the ability to make more educated energy efficiency related decisions, change energy consumption habits, and ultimately lower utility bills. This is enabled by providing customers with detailed iESP data through web or mobile portals, smart devices and in-home devices. PSE&G can also use this iESP data to design and offer energy efficiency products and services.
8	Customer Service & Call Center Performance	**Deployment scheduled Q3, 2024**	Enables the use of broader range of information (including iESP) to increase call center knowledge, improve service, improve customer satisfaction, and lower customer costs by bringing together historical and real-time information to support decision analysis and improve the customer experience.
9	Customer DER/PV/EV	**Deployed Q4, 2023**	Services and systems that will use iESP data to help assist customers with DER (solar, EV, energy storage) installations and the management of any power quality issues that occur as a result of variable DER load
10	Customer Device Safety	**Deployment scheduled Q3, 2024**	Enhances customer safety by using iESP data, such as alerts and voltage data to detect safety issues relating to customer meters and power connections such as hot sockets and fallen wires, and provide alerts to customers and PSE&G.
11	iESP Sensor, Network & Data Operations	**Deployed Q3, 2023**	Back office processes and systems that manage the initial iESP infrastructure deployment and the ongoing and updated Meter Operations business function including acquisition, warehousing, testing, installation, maintenance, data streams and quality, alarm management, and meter data management.
12	Automated Move in/Move out & Remote Disconnect/ Reconnect	**Deployed Q3, 2023**	This use case addresses the messages exchanged between Customer Operations processes and Smart Meter through the HeadEnd and Network when a customer move in or out request is issued by Customer Operations or other customer processes. PSE&G currently sends a metering service employee to move a customer in or out for a variety of reasons. With iESP, the turn on functions and on demand read functions to support these processes can be automated and performed remotely and instantaneously, thereby increasing customer satisfaction and efficiency across various customer processes. • Electric operations reduction due to MIMO and Collection activity automated. • Gas operations reduction due to remote MIMO and Collection activity automated: • Cost reduction due to 85k avoided truck roll costs for move in move outs
13	Remote Disconnect/ Reconnect	**Deployed Q3, 2023**	This use case addresses the messages exchanged between Customer Operations processes and Smart Meter through the HeadEnd and Network when a meter connect/disconnect request is issued by Customer Operations or other processes. PSE&G currently sends a metering service or collections employee to connect or disconnect the meter for a variety of reasons. With iESP, the reconnect/disconnect functions to support these processes can be automated and performed remotely and instantaneously, thereby increasing customer satisfaction and efficiency across various customer processes.

Use Case #	Use Case Name	Deployment Status	Use Case Overview & Value
			• Electric operations reduction due to remote turn-on/off of electric meters • Gas operations reduction due to remote turn-on/off of gas meters: • Cost reduction due to 171k avoided truck roll costs for move in standard turn on/turn offs • Cost reduction due to avoided truck roll costs for turn on/turn off type events • Reduction in writes offs due to energy consumed on inactive accounts. Being able to remotely detect and disconnect will reduce the occurrence. $20m written off yearly. Assuming 70% reduction due to iESP capabilities
14	Next Generation Meter-to-Cash	**Deployed Q3, 2023** (enables billing department to provide revised bills via AMI data) **Deployment scheduled Q3, 2024** (obtain missing interval reads)	With more granular and quality iESP data available, alongside numerous other internal data sources, PSE&G can optimize and re-invent their meter-to-cash processes and drive out inefficiencies, increase service, and reduce costs. The iESP data is significantly more accurate at the source and by mapping the data from the iESP to its end use, leakage can be detected more easily. The cost of these losses is spread across the customer base so any improvement ultimately reduces customer bills. • Billing cost reduction due to a decline of billing irregularities and analysis work • Collection cost reduction due to a decline of backoffice collection workload • Reduction in bad debt due to improvement in field collections. Being able to remotely detect and disconnect will reduce the occurrence. $60m written off yearly. Assuming 31% reduction due to iESP capabilities
15	Network Connectivity Analysis	**Deployment scheduled Q2, 2024**	PSE&G's electricity network is complex, covers a large area, and provides power to different customers at different voltage levels. Ensuring that the required sources and end-use loads are correctly represented in operations systems is often very difficult. The iESP end-point meters can extend the network model and enable a high level of accuracy of connections and phasing, which in turn results in better planning and operations performance, and enables many other network dependent use cases.
16	Outage Detection & Analysis	**Deployment scheduled Q2, 2024**	Uses outage data from operations systems and smart meters to identify and verify possible outage locations, as well as identify network sections and specific customers (and numbers) that are out of power. This data is provided and displayed in real-time, to allow analysis, fast response, and crew dispatch to the precise location (down to meter) with information on the potential cause of the outage in order to more quickly restore power and ensure all customers are restored.
17	Outage Response Notification (ETR)	**Deployment scheduled Q2, 2024**	Use iESP outage data to calculate and communicate reasonable, more accurate, and acceptable outage status and restoration times to customers in real time. This largely eliminates one of the most common customer complaints about utility service, *i.e.,* inaccurate estimated restoration times. Messaging solutions within scope of this use case include Interactive Voice Response (IVR), web portals, text messaging, social media, mobile applications, and press releases.

Use Case #	Use Case Name	Deployment Status	Use Case Overview & Value
18	Voltage Monitoring & Analysis	**Deployment Q3, 2024**	Using iESP data and other network data sources, voltage readings are captured, visualized, and system-wide analysis is run to determine locations where voltage violations exist both above and below nominal voltage. Utilities can utilize this information for accurate analysis of voltage issues and a base for voltage planning and optimization across the network. Further, this information can help planners identify strategic locations for deployment of Volt/VAR optimization equipment.
19	Asset Load/Phase Management, Balancing & Power Analysis (incl. Transformer Load Monitoring & Customer Load Curtailment/Limiting)	**Deployment scheduled Q3, 2024**	Using iESP data and other network data sources, load data is imported, aggregated, and visualized. Power flow analysis is run to examine and monitor loading profiles of every network asset along the feeder from the substation to the smart meter. This use case gives visibility of loading profiles and load flows of all network assets and customers with real-time or overnight iESP data updates. This information can be used by planners and operators to determine areas of overloading of assets on the system, plan responses to major events, execute asset balancing, and customer load curtailment.
20	Load Profiling & Forecasting	**Deployment scheduled Q3, 2024**	Capability that would enhance load profiles and forecasts by using iESP data in combination with network, customer billing or other data (*e.g.*, weather) to perform more detailed usage analysis. This is beneficial to customers and PSE&G planners by supporting optimized planning of load growth, which in turn leads to optimized capital spending and reliability of the network.
21	Distribution Losses	**Deployment scheduled Q3, 2024**	Distribution losses can be identified by comparing the iESP end-point meter usage data with usage data at the distribution entry point (*i.e.*, substation). Areas of high losses or network sections with particularly high losses can be identified through the analysis. Further analysis on the causes of the high losses will shed light into the different types of corrective / mitigating actions that can be taken to reduce the technical losses. Technical losses are spread across the customer base, so any improvement in this area could reduce customer bills.
22	Revenue Protection & Assurance	**Deployment scheduled Q3, 2024**	Revenue protection refers to the prevention, detection, and recovery of losses caused by interference with or theft of utility service. This use case will leverage smart meter consumption, as well as voltage and event data, to detect energy theft and meter tampering by employing multiple screening techniques, including cross-service correlations. Energy theft is spread across the customer base, so any improvement reduces customer bills.

Q. Please identify the Use Cases that have already been deployed.

A. PSE&G has already deployed or partially deployed the following 8 Use Cases:

- Use Case 1: Enhanced Customer Engagement
- Use Case 5: Customer Segmentation & Behavioral Analysis
- Use Case 7: Customer Energy Efficiency Programs
- Use Case 9: Customer DER/PV/EV

- Use Case 11: Sensor, Network & Data Operations
- Use Case 12: Automated Move in/Move out & Remote Disconnect/Reconnect
- Use Case 13: Remote Disconnect/Reconnect
- Use Case 14: Next Generation Meter to Cash

Q. Please describe the benefits currently being realized as a result of the installation and general functionality of installed AMI meters, use of the AMI meter data for billing, and the 8 Use Cases deployed to date.

A. Benefits of the CEF-EC program currently being realized through the CEF-EC program to date can be grouped as follows: meter reading/meter accuracy; benefits derived from remote capabilities; revenue integrity benefits; collections benefits; and customer access to their AMI data. I will generally describe each of these benefit types below:

<u>Meter Reading/Meter Accuracy</u>

Operational and customer benefits result from reduced labor and costs of meter reading and increased accuracy of bills due to a higher meter reading rate due to AMI. Please reference the Company's semi-annual reports in Schedule DJ-2 R-1 for meter read rates attributable to AMI.

<u>Remote Capabilities</u>

Currently remote meter reading, remote move-in/move-out, and remote disconnect/reconnect functionalities are enabled and are being used via installed AMI meters. Operational benefits from these functionalities include reduced costs through eliminating the need to dispatch trucks, and the efficiencies of completing these tasks remotely. Through February 29, 2024, there have been 28,301 reconnects following disconnection for non-payment completed remotely, avoiding a truck dispatch and greatly reducing the customers' wait time to be reconnected. Additionally, there have been

388,638 move-ins and move-outs completed remotely (meter reads, turn-ons, and turn-offs). There are also tangential environmental benefits because reducing the need to dispatch a truck reduces the overall greenhouse gas emissions from vehicles.

Collections Benefits

Field collectors now have the ability to disconnect an AMI meter remotely when they update a collection order on their hand-held device. This improves their efficiency and effectiveness. Before having remote turn-on and turn-off capability, the effective rate for a field collector visit was 28%.[6] Since the addition of this capability, the effective rate for a field collector on visits with AMI meters is greater than 90%. There have been 72,430 move-ins and move-outs remotely turned on and off, resulting in the reduction of unknown accounts and the revenue associated with these accounts (a subset of total remote move-ins/move-outs). In the future, this will result in reduced bad debt expense related to unknown revenues.

Customer Access to Their Data

Customers with AMI meters have access to PSE&G's AMI portal. The portal allows customers to view their usage, set usage threshold alerts, and access existing energy savings tips. The portal available to residential customers also has additional information about home energy assessments.

[6] A field collector visits is typically considered "effective" if it results in either a payment or a shut-off.

Q. Has the Company realized any additional benefits simply by virtue of replacing existing meters?

A. Yes. PSE&G's observations during meter replacement have resulted in PSE&G investigating 657 cases of tampering through February 29, 2024.[7] This yields a direct customer benefit, as detecting tampering reduces the costs of theft from meter tampering.

Q. Will AMI meters assist the company in detecting metering tampering and theft going forward?

A. Yes. As described in the table above, the current plan is to deploy an analytical tool by the end of the third quarter of 2024 that will enable identification of potential theft more quickly.

Q. Has the Company implemented the CEF-EC program in a manner consistent with the CEF-EC Order and with regard to customers wishing to opt-out of AMI meters?

A. Yes. The Company has complied with applicable reporting requirements and attempted to implement the program as efficiently as possible. The semi-annual reports submitted to the BPU are attached hereto as Schedule DJ-2 R1. Additionally, the Company has implemented the CEF-EC program in a manner consistent with the CEF-EC Order that fully recognized the rights of customers to opt out of the program. As of February 29, 2024, only 6,794 customers opted out of the AMI meter. This is an opt-out rate of less than one-half of one percent.

Q. Is the Company proposing in this case a change to the manual meter reading fee as was permitted by the CEF-EC Order?

A. No. The CEF-EC Order permits PSE&G to "provide testimony and actual cost information for these fees in its Next Base Rate Case, at which time these fees will be subject to review and

[7] Note that the original testimony attached to the Company's initial December 29, 2023 filing contained an error that misidentified this statistic through September 30, 2023. The number in the original testimony should have read "434 cases through September 30, 2023," not "9,134 cases through September 30, 2023."

modification."[8] However, and in order to achieve an equitable and appropriately non-discriminatory result for all customers, PSE&G is not currently collecting the manual meter-reading fees from opt-out customers. Therefore, there is not yet sufficient data to present in this matter regarding the actual costs based on all opt-outs that would support a change in the fee established in the CEF-EC Order. The CEF-EC Order states that "ongoing review and assessment of these fees will be subject to review and modification in future rate cases;" therefore, PSE&G anticipates it will present data related to actual costs of manual meter reads for the entire population of opt-outs in its next rate case.[9]

Q. How does PSE&G communicate these fees to customers that have chosen to opt out?

A. Any customer opting out was notified during the opt-out process that the $12 fee will begin to apply in 2024. PSE&G also intends to send each such customer a letter providing the opportunity to opt back in before PSE&G starts charging the fee. Any customer that opts back in will not be charged a fee.

Q. When will PSE&G begin charging customers the opt-out fees?

A. PSE&G will begin charging a customer an opt-out fee only after PSE&G sends that customer the letter described above providing that customer an opportunity to opt back in.

Q. The CEF-EC Order also established a one-time opt out fee for customers wishing to remove an AMI meter that was previously installed. Is PSE&G currently charging this fee?

A. Yes. PSE&G is currently charging this fee.

---

[8] CEF-EC Order at Stipulation ¶ 31.

[9] *Id.*

IV. ACCOUNTING AND COST RECOVERY FOR CEF-EC PROGRAM

Q. Did the CEF-EC Order establish a method for the Company to account for and recover the costs of the CEF-EC program?

A. Yes. The CEF-EC enables accelerated installation of AMI meters and retirement of legacy and non-AMI meters before they are fully depreciated. The prudence of the costs included in these regulatory assets is subject to review by the Board in this case. The Order provided that until the costs of the CEF-EC programs were rolled into base rates, AMI-related capital costs, legacy meter stranded costs, and AMI-related O&M costs would be deferred and placed in regulatory assets as separate and identifiable accounts. Specifically, the details are shown on Schedule MPM-16 R-1, the proposed amortization of the CEF-EC deferrals are shown on Schedule MPM-47 R-1, and the *pro forma* revenue requirement adjustment is shown on Schedule MPM-48 R-1.

Q. How are the projected O&M savings related to the CEF-EC Program reflected in the Company's filing?

A. In accordance with CEF-EC Order, PSE&G will include a reduction for future O&M savings after the test year. As described in Mr. McFadden's testimony, the Company is proposing a *pro-forma* adjustment to its revenue request in this proceeding to account for future O&M savings resulting from AMI that are not reflected in the test year and is shown on Schedule MPM-48 R-1.

Q. Does this conclude your direct testimony?

A. Yes. It does.

Re: Advanced Metering Infrastructure (AMI) Program - Semi Annual Report to the Board of Public Utilities for the Period January 1, 2021 - June 30, 2021

Dear Ms. Peterson and Mr. Lipman:

Pursuant to the Board's January 7, 2021 Order in the above referenced matter, enclosed is Public Service Electric and Gas Advanced Meter Infrastructure (AMI) Program's semi-annual report for the period January 1, 2021 through June 30, 2021.

Copies of the CEF-EC AMI Semi-Annual Report, January 1, 2021 – June 30, 2021 will be served upon all entities legally required to be noticed. Service will occur via e-mail, only, pursuant to the Board's March 19, 2020 Order in Docket No. EO20020254.[1] In addition, the report will be posted at www.pseg.com/ev.

Stranded Costs Deferred			**N/A**	**See Note H**

N/A – Not applicable at this stage of the AMI Program

Reporting Metric Notes:

A. Network Installation

Estimated Quantity of Work: 161 new poles and three radio gateways, 47 single-radio network gateways and 2207 routers are estimated to be installed beginning in July 2021 with completion by mid-2022 to support the expansion of the existing RF Network

B. Percentage of Network Communicating to L+G Platform

Estimated Quantity of Work: 100% installation of network to be completed by mid-2022

C. Actual Reads Recorded from AMI Meters

Actual read number is inclusive of large commercial AMI meters installed prior to start of current AMI Project

D. Customers who have authorized third party supplier access to their energy usage data

The development of a Data Access Plan has been deferred pending the statewide proceeding in Docket No. EO20110716. On August 23, 2021, in that docket, the BPU issued a Straw Proposal on Advanced Metering Infrastructure (AMI) Data Transparency, Privacy & Billing, and has sought written comment from all interested parties by October 7, 2021. Per that August 23, 2021 notice, after submission of comments, Board Staff anticipates having one or more stakeholder meetings to discuss that feedback and, once all feedback is received, Staff expects to recommend that the Board approve an MFR order on data access, among other things, which will be followed by a rulemaking proceeding to codify the requirements placed on each electric public utility with an AMI deployment plan. PSE&G is participating in that Board Staff proceeding.

E. Third Party Customer Engagement Efforts

PSE&G has utilized social media outlets for third party customer engagement efforts to date. The activities and results are as follows:

1. Published 17 messages:

a) *2 paid Facebook ads,*

b) *15 organic messages on Facebook, Twitter and LinkedIn:*

  (1) 5 on Facebook,

  (2) 9 on Twitter,

    (a) 7 on PSEGDelivers,

    (b) 2 on PSEGNews.

c) 1 on LinkedIn

2. Channel followers (as of July 2021):

a) *Facebook: 116,659*

b) *PSEGDelivers (Twitter): 101,704 followers*

c) *PSEGNews (Twitter): 20,418*

d) *LinkedIn: 55,182*

3. The social media posts generated:

a) *2,355,520 impressions (how many times an AMI social message was displayed),*

b) *Reached 797,462 Facebook users*

F. Remote Connects/Disconnects Performed

Use case not yet implemented

G. AMI Metering Tampering Cases

Use case not yet implemented

H. Stranded Costs Deferred

Expected to be available for next reporting period

Stranded Costs Deferred	**N/A**	**N/A**	**See Note I**	**See Note I**

N/A – Not applicable at this stage of the AMI Program

Reporting Metric Notes:

A. Network Installation

Estimated Quantity of Work: 161 new poles and three radio gateways, 47 single-radio network gateways and 2207 routers are estimated to be installed beginning in July 2021 with completion by mid-2022 to support the expansion of the existing RF Network

B. Percentage of Network Communicating to L+G Platform

Estimated Quantity of Work: 100% installation of network to be completed by mid-2022

C. Actual Reads Recorded from AMI Meters

Actual read number is inclusive of large commercial AMI meters installed prior to start of current AMI Project

D. Customers who have authorized third party supplier access to their energy usage data

The development of a Data Access Plan has been deferred pending the statewide proceeding in Docket No. EO20110716. On August 23, 2021, in that docket, the BPU issued a Straw Proposal on Advanced Metering Infrastructure (AMI) Data Transparency, Privacy & Billing, and sought written comment from all interested parties by October 7, 2021. Per that August 23, 2021 notice, after submission of comments, Board Staff anticipates having one or more stakeholder meetings to discuss that feedback and, once all feedback is received, Staff expects to recommend that the Board approve an MFR order on data access, among other things, which will be followed by a rulemaking proceeding to codify the requirements placed on each electric public utility with an AMI deployment plan. PSE&G is participating in that Board Staff proceeding.

E. Third Party Customer Engagement Efforts

PSE&G has utilized social media outlets for third party customer engagement efforts to date. The activities and results are as follows:

1. Published 6 messages:

a) *6 organic messages on Facebook, Twitter and LinkedIn:*
   - *(1)* 1 on Facebook,
   - (2) 4 on Twitter,
     - (a) 3 on PSEGDelivers,
     - (b) 1 on PSEGNews.
   - (3) 1 on LinkedIn.

2. Channel followers (as of December 2021):

a) *Facebook: 118,251*
b) *PSEGDelivers (Twitter): 101,942*
c) *PSEGNews (Twitter): 20,673*
d) *LinkedIn: 57,213*

3. The social media posts generated:

a) *18,523 impressions (how many times an AMI social message was displayed),*
b) *Reached 7,242Facebook users*

F. Remote Connects/Disconnects Performed

Use case not yet implemented

G. AMI Metering Tampering Cases

Use case not yet implemented

H. Stranded Costs Deferred

Expected to be available in future reports.

Re: Advanced Metering Infrastructure (AMI) Program - Semi Annual Report to the Board of Public Utilities for the Period January 1, 2022 – June 30, 2022 (Corrected Copy 03.01.2023)

Dear Ms. Peterson and Mr. Lipman:

Pursuant to the Board's January 7, 2021 Order in the above referenced matter, enclosed is Public Service Electric and Gas Advanced Meter Infrastructure (AMI) Program's semi-annual report for the period January 1, 2022 through June 30, 2022. This copy corrects an error on the original report previously issued September 1, 2022. The correction, which is to the figures on page 2 of the report for residential and commercial meters installed to date, is red-lined for your convenience.

Copies of the CEF-EC AMI Semi-Annual Report, January 1, 2022 – June 30, 2022 will be served upon all entities legally required to be noticed. Service will occur via e-mail, only, pursuant to the Board's March 19, 2020 Order in Docket No. EO20020254. [1] In addition, the report will be posted at www.pseg.com/ev.

N/A – Not applicable at this stage of the AMI Program

Reporting Metric Notes:

A. Network Installation

Estimated Quantity of Work: 159 new poles and three radio gateways, 53 single-radio network gateways and 2207 routers have been installed to support the expansion of the existing RF Network

B. Percentage of Network Communicating to L+G Platform

Estimated Quantity of Work: Network installation has completed.

C. Actual Reads Recorded from AMI Meters

Actual read number is inclusive of large commercial AMI meters installed prior to start of current AMI Project.

D. Meter Reading Staff

Meter reading staffing fluctuates for various reasons. Permanent Meter Readers continue to decline month over month via natural attrition. Additional temporary Meter Reading staff have been hired to support Collection activities and vacations.

E. Number of customers receiving energy saving messages

Reports issued on September 1, 2021 and March 1, 2022 reported data based on all PSE&G electric customers who had received energy saving messages. In this report and subsequent reports, this metric will indicate how many PSE&G electric customers with AMI meters have received messages based on the implementation of use cases 1, 2, 3, 4, 5 and 7. Use cases not yet implemented.

F. Customers who have authorized third party supplier access to their energy usage data

The development of a Data Access Plan has been deferred pending the statewide proceeding in Docket No. EO20110716. PSE&G is participating in that Board Staff proceeding.

G. Third Party Customer Engagement Efforts

PSE&G has utilized social media outlets for third party customer engagement efforts to date. The activities and results are as follows:

1. **Published 4 messages:**
   a) *4 organic messages on Facebook, Twitter and LinkedIn:*
      (1) 2 on Facebook,
      (2) 2 on Twitter,
         (a) 1 on PSEGDelivers,
         (b) 1 on PSEGNews.

2. **Channel followers (as of June 2022):**
   a) *Facebook: 118,384*
   b) *PSEGDelivers (Twitter): 102,165*
   c) *PSEGNews (Twitter): 20,860*

3. **The social media posts generated:**
   a) *16,224 impressions (how many times an AMI social message was displayed),*
   b) *Reached 14,009 Facebook users*

H. Remote Connects/Disconnects Performed

Use case not yet implemented. A. AMI Metering Tampering Cases

Use case not yet implemented.

I. AMI Metering Tampering Cases

Use case not yet implemented.

J. Correction issued for Meters Installed.

The ‘**Project to date 1/7/2021 to 6/30/2022**’ data figures for line items related to ‘residential meters installed’ and ‘commercial meters installed’ was corrected to read as 129,738 and 34,661 meters respectively.

Clean Energy Future-Energy Cloud

Advanced Metering Infrastructure (AMI) Program

Semi-Annual Report to the Board of Public Utilities

For the period January 1, 2023 – June 30, 2023

Reporting Metric Tables:

Metric Description	Jan-23	Feb-23	Mar-23	Apr-23	May-23	Jun-23	Current Reporting Period 1/1/2023 - 6/30/2023	Project to Date 1/7/2021 - 6/30/2023
Residential Meters Installed	80,150	76,707	85,227	79,610	83,894	80,954	486,542	877,514
Commercial Meters Installed	10.148	8,797	12,181	9,476	12,196	8,792	61,590	133,153
Network Installed								See Note A
Number of opt-out customers	414	371	571	622	428	239	2,645	4,557
Number of actual reads recorded from AMI meters each month	29,425,887	31,276,962	37,330,599	45,059,057	49,170,579	54,147,479	246,410,563	See Note B
Number of meter reading staff employed by PSE&G each month	332	312	295	302	331	325	See Note C	See Note C
Number of total visits by customers to AMI portal.	1,961	1,349	1,906	1,728	1,956	1,781	10,681	49,294
Number of unique monthly Log-in's to AMI portal.	131	128	142	116	134	135	786	N/A
Number of customers receiving energy saving messages.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	See Note D
Number of customers who have authorized third party supplier access to their energy usage data	N/A	N/A	N/A	N/A	N/A	N/A	N/A	See Note E
Third Party Program-to-date customer engagement efforts undertaken by the Company	N/A	N/A	N/A	N/A	N/A	N/A	N/A	See Note F
Number of AMI meters replaced due to functioning errors	32	7	3	9	7	17	75	227
Number of remote connects/disconnects performed	0	0	0	0	0	0	0	See Note G
Number of AMI meter tampering cases found	0	8	2	2	5	1	18	See Note H
Estimated CEF-EC project completion date							12/31/2024	12/31/2024

N/A – Not applicable at this stage of the AMI Program

CEF-EC-AMI Program
Semi-Annual Reporting (2023) – Period ending June 30, 2023

Average Installation Costs (Per Unit Cost in USD)			Current Reporting Period 1/1/20223-6/30/2023	Project to Date 1/7/2021 - 6/30/2023
Average Cost Residential Meters Installed –Total			**$175**	**$194**
Average Cost Residential Meters Installed – Labor *(1)			$58	$82
Average Cost Residential Meters Installed – Materials			$117	$112
Average Cost Commercial Meters Installed – Total			**$256**	**$272**
Average Cost Commercial Meters Installed – Labor *(1)			$89	$108
Average Cost Commercial Meters Installed – Materials			$167	$164

	FORECAST		ACTUALS	
Metric Description (USD in Millions)	**Current Reporting Period 1/1/2023-6/30/2023**	**Project to Date 1/7/2021 - 6/30/2023**	**Current Reporting Period 1/1/2023-6/30/2023**	**Project to Date 1/7/2021 - 6/30/2023**
CEF-EC Capital Costs - Total	**$114.1M**	**$244.9M**	**$114.7M**	**$245.5M**
CEF-EC Capital Costs - Labor *(2)	$10.0M	$40.8M	$8.8M	$39.6M
CEF-EC Capital Costs – Material	$54.9M	$110.1M	$61.3M	$116.5M
CEF-EC Capital Costs – Other *(3)	$49.2M	$93.9M	$44.6M	$89.3M
CEF-EC Deferred O&M Expenses - Total	**$12.2M**	**$32.2M**	**$8.0M**	**$28.0M**
CEF-EC Deferred O&M Expenses - Labor *(2)	$3.2M	$7.3M	$1.5M	$5.6M
CEF-EC Deferred O&M Expenses – Material		$0.6M		$0.6M
CEF-EC Deferred O&M Expenses – Other *(3)	$9.0M	$24.3M	$6.5M	$21.8M
Stranded Costs Deferred			**$27.0M**	**$81.8M**

*(1) Average Installation costs - Internal and External Labor.
*(2) Labor - Internal PSE&G Labor.
*(3) Other - Includes all contractors and Outside services.

Reporting Metric Notes:

A. Network Installation

Network Complete: 159 new poles and three radio gateways, 53 single-radio network gateways and 2207 routers have been installed to support the expansion of the existing RF Network

B. Actual Reads Recorded from AMI Meters

Actual read number is inclusive of large commercial AMI meters installed prior to start of current AMI Project.

C. Meter Reading Staff

Meter reading staffing fluctuates for various reasons. Permanent Meter Readers continue to decline month over month via natural attrition. In May 2023, additional temporary Meter Reading staff had been hired to support Collection activities and vacations.

D. Number of customers receiving energy saving messages

In this report and subsequent reports, this metric will indicate how many PSE&G electric customers with AMI meters have received messages based on the pending implementation of use cases 1, 2, 3, 4, 5 and 7~~.~~

E. Customers who have authorized third party supplier access to their energy usage data

The development of a Data Access Plan has been deferred pending the statewide proceeding in Docket No. EO20110716. PSE&G is participating in that Board Staff proceeding.

F. Third Party Customer Engagement Efforts

PSE&G has utilized social media outlets for third party customer engagement efforts to date. The activities and results are as follows:

1. Published 0 messages:

a) *0 organic messages on Facebook, Twitter and LinkedIn:*

- *(1)* 0 on Facebook,
- (2) 0 on Twitter,
  - (a) 0 on PSEGDelivers,
  - (b) 0 on PSEGNews.

2. Channel followers (as of June 2023):

a) *Facebook: 117K*

b) *PSEGDelivers (Twitter): 101K*

c) *PSEGNews (Twitter): 21K*

3. The social media posts generated:

a) *0 impressions (how many times an AMI social message was displayed),*

b) *Reached 0 Facebook users*

G. Remote Connects/Disconnects Performed

Use case not yet implemented.

H. AMI Metering Tampering Cases

Use case not yet implemented.

Re: Advanced Metering Infrastructure (AMI) Program - Semi Annual Report to the Board of Public Utilities for the Period July 1, 2023 – December 31, 2023

Dear Ms. Peterson and Mr. Lipman:

Pursuant to the Board's January 7, 2021 Order in the above referenced matter, enclosed is Public Service Electric and Gas Advanced Meter Infrastructure (AMI) Program's semi-annual report for the period July 1, 2023 through December 31, 2023.

Copies of the CEF-EC AMI Semi-Annual Report, July 1, 2023 – December 31, 2023 will be served upon all entities legally required to be noticed. Service will occur via e-mail, only, pursuant to the Board's March 19, 2020 Order in Docket No. EO20020254. [1] In addition, the report will be posted at www.pseg.com/ev.

1577180 v1 1 *In the Matter of the New Jersey Board of Public Utilities' Response to the Covid-19 Pandemic For a Temporary Waiver of Requirements for Certain Non-Essential Obligations*, Docket No. EO20030254, p 3 (March 19, 2020 Order).

Please advise if you have any questions or comments.

Very truly yours,

Katherine E. Smith
